Deaths by Burning	226–229
Public Institutions	229–231

INDEX of DISTRICTS, referring by Numbers to the several TABLES of ABSTRACTS	233–236

REPORT

TO

The Right Honourable Sir GEORGE GREY, Bart., G.C.B., M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

General Register Office, Somerset House,
28th March 1863.

SIR,

I HAVE the honour to submit to you my Annual Report for the year 1861.

The progress of population in England in the last quarter of a century may be stated roundly, and in such a manner, that it may be remembered without difficulty. Each quinquennial period added a million or a little more to the account. In 1836–40 the population was rising through its sixteenth million; in 1841–45 through its seventeenth; in 1846–50 through its eighteenth; in 1851–55 through its nineteenth; and in 1856-60 through its twentieth million. In the middle of 1861 it is estimated to have reached 20,119, 496. The English registration now comprehends within its scope a population greater by the present populations of London, and the three Ridings of Yorkshire combined, than it was when the national system was established in 1837.

In 1861 the marriages were less numerous than they had been in either of the two previous years; the births were more numerous than they had ever been in England; and though the year was healthy, the deaths were more numerous than they had been in 1860, which was still healthier.

In 1861 there were enrolled of persons who married, 82,000 more than had been registered in 1841, twenty years before; 91,000 died *more*

TABLE I.—Estimated **Population,** with the Number of **Marriages, Births,** and **Deaths** registered in **England,** in each **Year** from **1838** to **1861.**

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of the Years.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS.	EXCESS OF BIRTHS OVER DEATHS.

1855	18,829,104	152,113	304,226	635,043	425,703	209,340
1856	19,042,548	159,337	318,674	657,453	390,506	266,947
1857	19,256,680	159,097	318,194	663,071	419,815	243,256
1858	19,471,472	156,070	312,140	655,481	449,656	205,825
1859	19,686,895	167,723	335,446	689,881	440,781	249,100
1860	19,902,918	170,156	340,312	684,048	422,721	261,327
1861	20,119,496	163,706	327,412	696,406	435,114	261,292

* The Population of each of the years since 1851 is deduced from the ascertained rate of increase observed in the twenty years, 1841–61; and an allowance is made for the decrease in the rate during the latter ten years.

than in 1841; and 184,000 children were born *more* than in the same year. The aggregate number of names entered in 1861, as of persons who had married, who had been born, or who had died, is 1,458,932.

On an average of twenty-four years 1639 persons were married, 3318 children were born, and 2229 persons died to 100,000 of the population; but in 1861 the respective numbers were 1628, 3461, and 2163. Marriages were rather below the standard mark of activity. The birth-rate was high. The death-rate was below the average.

The excess of births over deaths in the year was 261,292. The conjunction of a high birth-rate with a low death-rate caused that excess to be greater than the usual amount, which in the present stage of the population may be stated as nearly 245,000. About 30,000 English emigrants left their country for foreign and colonial settlements in 1861.

Marriages.

The number of marriages in the year was 163,706. The proportion to the population was ·814 per cent.; or in every hundred persons 1·628 were married (the average being 1·639). The marriage-rate has been accelerated since 1849; for in the twelve years 1850–61 it has been in a majority of cases 1·7 per cent., and not in any year below 1·6 per cent.; whereas in the twelve years 1838–49 it was in a majority of years under 1·6 per cent., and only in two instances 1·7 per cent. The prosperity of the people during the later period found its natural expression in the increased frequency of marriages.

Out of the total number of 163,706 marriages, 130,697 were solemnized according to the rites of the Established Church. Of the latter number 102,955 were after publication of banns; 20,090 by licence; 4048 by superintendent registrar's certificate; 16 by special licence. This statement, however, does not represent the real numbers with perfect accuracy, as 3588 marriages were not distinguished in the registers in respect to

---

Mean . .	·819	1·639	3·318	2·229	122	61	30	45

Note.—The Table may be read thus:—In the year 1838 to every 100,000 persons living there were 771 marriages or 1542 persons married, 3029 births, 2238 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 65, 33, and 45 respectively. A correction for increase of population has been made in calculating the above results.

these particulars. It will not be far from the truth to state, that for one person who is married after licence, five are married after banns.

The number of marriages performed otherwise than agreeably to the forms of the Established Church was 33,009. Roman Catholic marriages were 7782; those in the registered chapels of other religious denominations 13,182; those of Jews 262; of Quakers 58; while marriages contracted in Superintendent Registrars' offices were 11,725. In 1851 the marriages in the Established Church were about 131,000; in 1861 they were nearly the same number. In 1851 those not performed in the Established Church were about 23,000; in 1861 they were 33,000. It appears from these figures that an increase of 9000, which the *total* marriages in 1861 exhibited, as compared with those in 1851, was appro-

priated by persons who married according to other rites than those of the Established Church.

In 1861 there were in England and Wales 4564 buildings belonging to Roman Catholics and dissenting denominations, and registered for the solemnization of marriages. A third part of that number belonged to Independents; a thousand to Baptists; 895 to Wesleyan Methodists; 551 to Roman Catholics; 193 to Calvinistic Methodists; 152 to Unitarians; 137 to Scottish Presbyterians; 141 to various other bodies, who have not yet acquired numerical importance.

Although the eleventh division (Monmouthshire and Wales) does not contain half the population of London, there are 710 religious buildings registered for marriages in that division, while in London there are but 309. Cheshire and Lancashire have little more than the population of London, but the registered buildings in those counties are twice as numerous as those of the metropolis.

Re-marriages.—There were more than twice as many marriages between widowers and spinsters as between bachelors and widows; the

1851	·858	5·591	·130	·728	38	6

* Disregarding the decimal point, this will read 804 marriages were celebrated to every 100,000 of the population; 135 were marriages by licence, 669 were marriages by banns. It may be assumed that these two groups represent the whole of the corresponding classes of society, whether belonging to the Church or not.

respective numbers were 15,067 and 7034. Widows were married in greater number by widowers than they were by bachelors.

In 100 men who married, the proportion of widowers was 14; in 100 women who married the proportion of widows was 9.

The marriages of widowers bore the highest proportion in Somersetshire, where they were 16·8 per cent. of the total number. The smallest proportion was in Herefordshire, where it was 9·62. In the latter county the number of widows who obtained husbands was almost as great as that of widowers who got wives, though on the average of England the number of widows marrying is only two thirds of that of the widowers who marry. After a destructive war, or in districts where men are engaged in unhealthy occupations, there will be few widowers, but many widows; and the alliances which they respectively contract will also be few and many.

For one widower who marries a widow, there are nearly two who marry spinsters.

Minors.—Of persons who married under 21 years of age, there were thrice as many women as men; the exact numbers were 31,927 and 10,415. In 100 males who married 6·36 were not of full age; in 100 women 19·50 had not attained the age of 21 years. In Buckinghamshire, Huntingdonshire, Staffordshire, West Riding of Yorkshire, and Durham, more than a fourth part of the women who married encountered the duties and responsibilities of the married state, while they were still under age. Of young men marrying before their majority the largest proportion was in Buckinghamshire, Huntingdonshire, and Bedfordshire. Life in London appears to discourage and repress early alliances; for the proportions were only 3·48 for males, and 13·51 for females. The expensiveness of house accommodation is, no doubt, one important restraining influence in the metropolis.

44	North Wales - - - - -	·677	62·8	48·5	4·40	13·01	13·08	8·19

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 814 marriages took place; of 1,000 men married 754, of 1,000 women 653, signed the marriage register by writing their names; of 10,000 men married 636 were not of full age, of 10,000 women married 1950 were not of full age; of 10,000 men married 1403 were Widowers, of the same number of women married 912 were Widows.

was 40,204, that of women 56,770. But the schoolmaster is abroad over England; and though the absolute number of persons who sign with marks is not reduced within the last twenty years, it has been prevented from increasing with the number of the marriages. In 1861 the marriages were more by 41,000 than they were in 1841; but the men who signed with marks were hardly more in 1861 than they were in that earlier year, and the women were rather less. The mark-signatures fell from 41 per cent. of marriages in 1841 to 30 per cent. in 1861.

Of 100 men and 100 women who married, 75 of the former and 65 of the latter wrote their names in the Registers. In an educational comparison based on the mark-test, there is no English county which stands so well as London; and this superiority holds both with men and women, though only in a small degree with the latter. The proportions of persons in London educated so as to be able to write their names are 89 and 82 in 100 of those who marry.

The greatest amount of ignorance in the elementary art of writing is found in the following counties, where the proportion of marrying men able to write fell below 70 per cent.:—Berkshire, Hertfordshire, Buckinghamshire, Huntingdonshire, Bedfordshire, Cambridgeshire, Essex, Suffolk, Norfolk, Wiltshire, Cornwall, Herefordshire, Shropshire, Staffordshire, Monmouthshire, North and South Wales. In the Welsh division, which includes Monmouthshire, the proportion ranged so low as 60 and 65. Hampshire, Devonshire, Rutlandshire, and still more the East and North Ridings of Yorkshire, Northumberland, Cumberland, and Westmorland, may be mentioned amongst the better educated parts. Generally the men in the northern counties have received more education than those in the southern.

It is deserving of notice that, by the marriage-signature test, the women in Sussex, Berkshire, Hertfordshire, Essex, Suffolk, Norfolk, and a few other counties are better educated than the men; but in the northern portions of the kingdom this anomaly is not observed; and it is a very

Births.

In 1861 the births of 696,406 children were registered; 355,972 were boys, and 340,434 were girls. These numbers are exclusive of the still-born, who are not required to be registered. The birth-rate was 3·461 per cent. of the population, or one birth to 29 persons living. It was higher than the mean rate, which is 3·318, or one to 30. The highest that has been obtained since the Registration Act came into operation was 3·504 in 1859.

Sex.—Males were born to females in the proportion of 104·6 to 100. In Northumberland the proportion of male-births was as high as 108; in Rutlandshire nearly as high as 110. Somersetshire presented the only exception to the rule; in that county the boys were in the proportion to girls of only 99·9 to 100.

Seasons.—It invariably happens that births are more numerous in the first six months of the year than in the last six months. If 1000 be taken to represent the average number of births in each quarter, then the proportional numbers in 1861 will run in the March, June, September, and December quarters, as follows:—1007, 1064, 980, and 949.

Children born out of wedlock.—The number of illegitimate births was 44,157; of which 22,728 were births of males, 21,429 those of females. Of every 100 births *in* wedlock and *out of* wedlock, 6·3 belonged to the latter category. In London the proportion of the illegitimate was only 4·4 per cent. In Norfolk it was 10·3; in Westmorland (a well-educated county, where men and women can write their names), it was 10·6; in Cumberland 11·2. In Monmouthshire and Wales, where education is low, illegitimacy is not high; the proportion of children born out of wedlock to the total births being 6 or 7 per cent.

Amongst illegitimate children the proportion of males born to females is higher than it is amongst the legitimate.

It has been shown that the birth-rate of England (without reference to the distinction of legitimacy) was 3·46 in 1861. But the rates in the

---

1861	693,406	652,249	44,157

several counties exhibited considerable variety. Amongst the least prolific populations were those of Surrey (the extra-metropolitan part of it is here referred to) and Sussex, where the rate was 3·05; and though in Kent (extra-metropolitan) it was 3·30, it is found that the birth-rate was

in the West Riding 3·71; and in Staffordshire and Durham the birth-rates rose to 4·02 and 4·03.

Deaths.

The deaths of males were 222,281; those of females were 212,833; the total 435,114. The death-rate was 2·163 per cent. The mean rate of 1852–61 is 2·221.

England was generally healthy. The mortality was below the average in all the counties, with the exception of those that follow:—Bucking-

hamshire, Huntingdonshire, Cambridgeshire, Suffolk, Norfolk, Shropshire, East and North Ridings of Yorkshire, Northumberland, Cumberland, and North Wales.

Sexes.—Males died at the rate of 2·268 per cent. of the male population. Females died at the lower rate of 2·063 per cent. of the female population. If equal numbers living of the sexes are taken, the deaths of males were in proportion to those of females, as 110 is to 100. But in the population as actually constituted, the females have a great preponderance, and the deaths of males were 104 to 100.

Seasons.—The mortality was below the average in each quarter; but the spring quarter was comparatively the healthiest. The following is a summary of the Quarterly Reports.

SUMMARY OF THE QUARTERLY REPORTS, 1861.

First Quarter—January, February, March, 1861.

The state of the public health during the winter has not been on the whole unfavourable, and the mortality has been rather lower than the average. The decrease of the birth rate may be partly due to some arrears of registration, arising from the employment of the Registrars in making arrangements for taking the Census. The marriages, which were numerous in the concluding quarter of 1860, fell under the pressure of adverse circumstances in the first quarter of 1861.

Marriages.—The number of persons married in the winter quarter was 66,548. Of ten thousand of the population 135 were married, but if the marriage-rate had been equal to the average for that quarter, the number would have been 142. Tables that run through a series of years show that the people are less inclined to enter into wedlock in the first than in any of the succeeding quarters, and in the present year that season was eminently unpropitious in consequence of the severe frost and dearness

TABLE XIV.—**Annual Rate of Mortality** of Males and of Females in **England, 1838–61.**

Average of 24 years, 1838–61 - -	2·316	2·143	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·335 deaths of males; to every 100 females living there were 2·133 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of equal *numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

of provisions. The average weekly number of recipients of in-door and out-door relief exceeded by 53,296 that relieved in the winter of 1860. From a comparison of corresponding quarters of 1859-61, it appears that the decline in marriages was general over the country. In London they fell from 5751 and 5665 to 5305; in Staffordshire from 1497 and 1426 to 1217; in South Wales from 1173 and 1205 to 1021. Kent and Oxfordshire were exceptions to the rule, for in those counties marriage was brisk. Sturminster, Blandford, Dorchester, Sherborne, Beaminster, and Bridport

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 3,032 births, and 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

births registered in the corresponding quarter of the previous year, when the number was unusually high.

The birth rate of the quarter was 3·500 per cent., the average being 3·594 per cent.

Increase of Population.—The registered increase of population in 90 days was 51,718; and it was at the rate of 575 daily.

There is no account of the immigration; but according to the returns about 4640 persons of English origin sailed in the three months from the ports at which there are agents; 2065 to the United States, 2019 to the Australian colonies, 25 to the North American colonies, and 531 to other parts.

From the United Kingdom 16,537 emigrants sailed.

Prices, the Weather, and Pauperism.—All these matters are connected together, and affect the public health. The price of wheat was 55*s.* 1*d.* a quarter; and it exceeded by 10*s.* 8*d.*, or 24 per cent., the price in the previous winter quarter.

The mean price of beef at Leadenhall and Newgate markets was 5⅛*d.*, and of mutton 6⅝*d.* per lb. Best potatoes were 147*s.* 6*d.* a ton.

The mean temperature of the quarter at Greenwich was 39·9°, or 1·8° above the average of 90 years; the dew point was 38·7°, or one degree above the average; so the degree of humidity was 89, also above the average, shown still further by the fogs which prevailed throughout the country during the greater part of the month of January, 16 days in February, and 6 days in March. Snow fell on 38 days; and the amount of rain-fall was 4·5 inches, giving half an inch below the average. The air moved horizontally at the rate of 11 miles an hour. The barometer was slightly below the average; high in January; low in March. The meteorology was in some respects extraordinary; the temperature of January was excessively low, while the temperature of February and March was above the average. The cold set in on the 3d of January, and increased until on the 9th of January the temperature at night fell to 11°, whilst the highest temperature of the following day was 24°. In many districts Mr. Glaisher shows that the temperature fell lower than it fell at Greenwich. The temperature of the first half of the month, 28·3°, was lower than the temperature of the same period of any of the last 20 years. Of extremely cold Januaries 11 occurred in the 30 years 1770—1800; 11 in the next 30 years; and only 5 in the 30 years ending in 1861. The immediate effect of extreme cold is to destroy the lives of many aged persons, and those suffering from asthma and other chest diseases; large numbers are also thrown out of employment.

The untowardness of the season consequently threw a large number of the poor on the parish, and 889,088 paupers on an average received relief. This number exceeded by 53,296 the paupers on the lists in the previous winter.

State of the Public Health.—121,215 deaths were registered in the quarter; and this number was rather lower than the number of deaths in the winter quarter of the preceding year.

The death-rate was 2·453; the average rate of the season being 2·482.

The increase of the population in particular parts of the country is uncertain; but assuming that the estimated rates of increase are tolerably correct, the mortality (2·658) in the town districts was about the average, whereas the mortality (2·210) in the country districts was below the average.

121,215 deaths were registered in the quarter; and as at the rate prevailing in the least unhealthy districts the deaths would have amounted to 88,355, the unnatural deaths may be set down as about 32,860, referable directly to the circumstances unfavourable to life in which the population is living. Painful as this recorded loss of life is, it is yet

gratifying to know that nearly all those fatal circumstances admit of mitigation by sanitary measures.

The health of LONDON during the winter is described in the Summary of the Weekly Tables. The deaths, 18,614, amounted to about the same number as occurred in the previous winter.

In the SOUTH EASTERN COUNTIES the mortality was somewhat lower than usual. The mortality was high in the Woking sub-district, Surrey. In two families 5 persons died of diphtheria; and the fatal cases that have fallen under the notice of the Registrar, have been in parts badly drained, with a clay subsoil. Brenchley, Hythe, and Folkestone in Kent have been visited by scarlatina, measles, whooping-cough, or fever, which have raised the mortality of the districts of Tunbridge and Elham. Sussex has been generally healthy. In Brighton, however, 431 persons died. And in the sub-district of Worth diphtheria attacked several persons, but all except one patient recovered under early treatment. Here diseases of the mucous membranes have prevailed, chiefly in low situations, with cesspools; and they have been attributed generally to the cold, damp air, and unwholesome food. The practice, the Registrar justly says, of depositing dirt in pits contiguous to the back doors of houses is very injurious; and the people of Worth should look to it in time, otherwise severer plagues may visit them.

The deaths (6950) in the SOUTH MIDLAND COUNTIES are below the average number; and it is only in Huntingdonshire and Cambridgeshire that there is a slight increase. Small-pox was nevertheless exceedingly fatal in some parts of Northamptonshire. In the St. Giles's sub-district of Northampton alone 21 deaths from small-pox are registered; in the sub-district of Wellingborough it attacked a large number of adults, and 24 victims perished. In Daventry 8 deaths, in Peterborough 4 deaths were wrought by the same agency, which might have been arrested by vaccination. The loss of life in considerable towns is doubly deplorable, as information and the means of relief are within the reach of the parents who see their children die. In addition to small-pox, diphtheria broke out in the Huntingdon district; and in Caxton, Cambridgeshire, 11 deaths from diphtheria occurred, 3 happening in one family within 11 days. This epidemic, with whooping cough and measles, account for the increase of mortality in the two counties.

The EASTERN COUNTIES, exposed to the winds that blow from the continent over the German Ocean, experienced a lower rate of mortality than prevailed in the previous winter quarter. The deaths were 6225. Several cases of diphtheria were fatal in parts of the districts of Chelmsford, Cosford, Flegg, and Freebridge Lynn. In East Dereham the deaths exceeded the births; and the severe weather induced fatal bronchitis in this and other districts.

The SOUTH-WESTERN COUNTIES also experienced a reduced rate of mortality and the deaths amounted to 9957. The city of Salisbury lost only 32 of the inhabitants by death; and other districts were equally favoured. No death was registered in the sub-district of Bradworthy, comprising a population of about 1000. A lady of 103 years of age, wanting five days, died in March at Shaldon in the Teignmouth sub-district. It is another of the rare instances of individuals of our race living through the whole of the natural cycle of human existence. The evidence of these extreme ages should be always carefully investigated. Small-pox has been prevalent in the district of Totnes; diphtheria in Torrington, Camelford, and Taunton. Seven persons were drowned by shipwreck in January off the coast of Penzance; and the deaths were 40 above the average in the sub-district of St. Just in Penwith. Whooping-cough was very prevalent in Camborne, Redruth, as well as in Penzance; and some deaths from scarlatina and typhus were also registered there. Bedminster, the last district in Somersetshire, suffered from measles, which caused an increase of deaths. The adjoining registrars of Bristol do not

account for the increase of the mortality in their district; but the registrar of Clifton notices the fatality of whooping-cough and bronchitis, which he refers to the long continuance of easterly winds.

The West Midland Counties (Gloucester, Hereford, Salop, Stafford, Worcester, and Warwick), experienced a reduced rate of mortality; and 14,520 deaths were registered in these counties. Diphtheria was rife in the district of Stow-on-the-Wold; and 7 deaths from the disease were registered in Bourton-on-the-Water. Shrewsbury suffered from measles; and the mortality of this county town is much above the average, not only of healthy districts but of London. Its sanitary evils undoubtedly admit of remedy, as it occupies an admirable site on the Severn.

By a very laudable regulation, the sextons in Newcastle-under-Lyme are not allowed to bury still-born children without a written permission; and the registrar states, that as such cases have been numerous during the quarter, the number of children born alive and registered under the Act is materially diminished. Besides suffering from the severe weather the people of Birmingham suffered from the bad state of trade, "which necessarily involved great privation among the working classes."

In the North Midland Counties the 7278 deaths were below the average.

20,271 deaths were registered in Lancashire and Cheshire; the increase on the preceding winter quarter exceeded a thousand. The mortality increased in the districts of Liverpool and West Derby, and decreased in Manchester and Salford. Ashton, Oldham, Chorley, Preston, and Fylde also experienced an increase in their rates of mortality. The Registrar of Deansgate, Manchester, points out the singular absence of zymotic disease. But the mortality among children is high; as it was also in Spotland-further-Side, Rochdale, where the registrar thinks many of the deaths of children may be accounted for by the fact that their mothers work in the factories up to within a few weeks of their confinement.

12,845 deaths were registered in Yorkshire. The number differs little from the numbers in the two previous winters. Diphtheria has prevailed to some extent in York; and the mortality was there above the average, as was also the case in Bradford. The deaths in Leeds and Hunslet were 1615; in Sheffield 1001. In Northallerton 15 out of 89 of the children born were of illegitimate birth; which is partly, perhaps, explained by the fact that two only of the parents of twelve children in a township could write their names.

7129 deaths were registered in the Northern Counties, where the mortality has been unusually high from the prevalence of scarlatina, diphtheria, typhus, and measles.

In Wales and Monmouthshire the 8003 deaths were below the average number. Considerable depression prevails in some of the iron works; but the masters continue to give employment to their men as far as is practicable. At Llanfair the bread is unwholesome, provisions dear; and the deaths exceeded the births in number. But the returns are rarely of this unfavourable character.

Second Quarter—April, May, June, 1861.

The leading facts of the Return may be briefly stated:—The marriages were comparatively few in the first quarter of this year; they became more numerous in the second quarter, which indeed happens invariably in England; but still they did not quite attain the average for the June quarter; many more children than usual were born in the second quarter of this year; and in the same period fine weather, and perhaps other than meteorological causes, were on the whole favourable to health, for the death-rate was not quite so high as the average.

The POPULATION resident in England as enumerated at the Census of 8th April 1861 was 20,066,224. The rate of increase in the last decennium was 12 per cent.

Marriages.—The number of persons married in the spring quarter was 84,024. The marriage rate was 168 to ten thousand of the population, which is less by 3 than the average, and less by 9 than the annual number married in the same quarter of 1860, when as is shown by the Returns of the Poor Law Board, the labouring class were in a more thriving condition. By surveying the eleven great divisions of England, as these are constituted in the Tables, and with reference to their several contributions to the marriage-list, this result will be discovered—that there was a decrease of marriages last spring as compared with the same period of 1860 in all of these divisions except two. The South-eastern counties, especially Surrey, maintained a fair proportion ; and in the Northern counties there was a very manifest increase. Durham, Sunderland, Gateshead, Tynemouth, and Carlisle were in a prosperous condition, if, as may be presumed, a willingness in the unmarried to form the marriage relation, and a confidence in their ability to undertake its responsibilities, be the test of prosperity in England.

Births.—The number of children born in the quarter that ended June 30th was 184,820, which is higher than the number born in any quarter of any previous year. The birth rate was very nearly 37 per 1000 of the population, whilst the average is less than 36. In only one of the forty-two quarters that have passed since 1850 has the rate exceeded 37 per 1000. All the counties, with a few exceptions, of which Rutlandshire may be mentioned as one, contributed a portion, more or less of the increase of last quarter. In London the births rose from 22,251 in the spring quarter of 1860 to 24,916 in that of the present year. In Devonshire they rose from 4316 to 4758. Manchester, Salford, and Chorlton exhibited a considerable increase ; in West Derby, also, the births were numerous ; but in Liverpool they did little more than maintain their level.

Increase of Population.—The increase of population as disclosed by the registers of births and deaths was 77,262, for to that extent the former exceeded the latter. The rate of increase was equal to 849 daily.

According to the emigration return, about 8505 persons of English origin left ports in the United Kingdom, of whom 5241 were bound for the United States, 776 for the North American Colonies, 2155 for the Australian Colonies, 333 for other places. The total number of emigrants, including about 1700 foreigners, was 37,987, of whom 25,562 went to the United States. The Irish element formed nearly two thirds of the whole emigration. The Scottish part of it showed a clear preference for Australia.

Of persons who enter this country as travellers or settlers no account can be rendered.

Prices, the Weather, and Pauperism.—The price of wheat was 54*s.* 9*d.* a quarter, and was higher by 2*s.* 1*d.* than in the previous June quarter, and by 7*s.* 6*d.* than in that of 1859. The mean price of beef in Leadenhall and Newgate markets was $5\frac{3}{8}$*d.* ; both highest and lowest prices were less than in the same quarter of 1860, which also held in respect of mutton, the mean price of which was $6\frac{1}{4}$*d.* Best potatoes averaged 130*s.* per ton ; they were dearer than in the same quarter of 1859, cheaper than in that of 1860.

The mean temperature of the air at Greenwich was 51·8°, which is 0·4° below the average for the same three months in 90 years. The weather was cold till the middle of May, when it became comparatively warm, and there was from the 20th of that month to the end of June an average daily excess in the temperature of one degree. On May 23d the temperature reached 80° ; the highest temperature of last year occurred on the same day, but did not exceed 76·5°. It reached 82°, nearly, on

the 19th June. The fall of rain in the quarter was 4·5 inches, which is 1·3 inches below the average. There was snow on 27th April in great part of the country; it fell on the 4th May at Brighton, Banbury, Berkhampstead, and Bywell. Full meteorological details by Mr. Glaisher are subjoined to this Report.

Weather of singular severity in January inflicted great suffering on the poor, and the number of persons entitled to in-door and out-door relief was swelled to unusual magnitude. The paupers on the lists in the subsequent spring quarter (April, May, June) were reduced, but were still very numerous, and on a weekly average were 831,587, against 799,434 in the corresponding season of last year.

State of the Public Health.—The number of deaths in the quarter that ended June 30th was 107,558; in the same period of last year it was 110,869. The annual death-rate for the quarter was 215 to ten thousand persons living, whilst the average is 221.

Both town and country populations have enjoyed a slightly improved degree of health; for dividing England into two portions, one chiefly urban and nearly equal in amount of population to the other chiefly rural, it appears that the rate of mortality in town was 228 per 10,000 (against an average of 235), and that in the country it was 200 against 204. In either instance the result of comparison is on the side of salubrity, though as regards the country the degree of improvement is almost imperceptible. The difference in the rates of country and town during this quarter may be stated thus:—Taking equal populations, for 200 persons who died in the former, 200 + 28 died in the latter.

If the rate of mortality that is found to rule in the least unhealthy districts had prevailed this quarter throughout England, the total deaths enumerated would have been, not 107,558, but 85,852. Consequently a certain portion of the registered mortality may be termed unnatural, and is represented by 21,706 deaths. This large contribution levied on human life is to a great extent the penalty paid for ignorance or neglect of those social arrangements which it is the business of sanitary reformers to invent and to recommend.

The deaths in London were 15,230, against 13,801 and 14,932 in the two corresponding quarters of 1859–60. Whooping-cough was unusually fatal, and in thirteen weeks carried off 1151 children. Zymotic diseases were the cause of rather more than a fifth part of the mortality. The metropolitan population was 2,803,989.

In the South Eastern Counties, which contain a population of 1,847,661, the deaths were 8239, and exhibited a decrease on the returns of two previous corresponding quarters. They were to the births as 8 to 14. The following places may be cited as examples of comparative health in the recent spring: Farnborough, Tenterden, Romney Marsh, Brighton, Midhurst, Westbourne, Southampton (where there were 185 deaths to 404 births), Winchester, and a great portion of Berkshire. The registrar of South Bersted (Chichester) remarks that his number of deaths was by far the smallest he had registered, though the population had increased; that "the weather had been very dry, and illness had been "less than had been known in the corresponding months for many years." Diphtheria visited Woking and Ripley in the district of Guildford, Farnham and Horsham; and at Rotherfield in Sussex 10 cases of that disease are reported. Thirteen deaths from measles were recorded at Folkestone, and it continued to prevail there.

The population of the South Midland Counties is 1,295,497, and the deaths were 6484. Though the mortality of this division was not so high as in the same period of 1860, the returns from many parts of it indicate a rather unfavourable condition of health. The deaths in Amersham in Buckinghamshire rose to 118, and at Beaconsfield, which is part of that district, the deaths much exceeded the average, and were considerably more numerous than the births. The registrar of Beaconsfield

mentions some fatal cases of malignant scarlatina, and adds that the poor people are not accustomed to sufficiently ventilate and purify their dwellings. In Northamptonshire generally the mortality was not high, and in Northampton it was low, the deaths in this district being 227 to 419 births; but at Peterborough and Eye small-pox was prevalent, and at the former place there was also diphtheria, which was fatal in 7 cases. Some districts in Cambridgeshire returned an increased number of deaths, viz., Caxton, Ely, North Witchford, Whittlesey, and Wisbeach. "At the present time," says the registrar of Chatteris in North Witchford district, "there are but few houses in my sub-district free from measles;" and the workhouse at Wisbeach, in which the mortality was considered to be high, is stated to be crowded with inmates, and defectively drained.

The Eastern Counties, with a population of 1,142,580, returned 6092 deaths, against 6226 in the June quarter of 1860. The numbers were heavy in Ipswich and Hoxne districts. At Stebbing in Essex the deaths were nearly double the average. At Wenhaston in Suffolk measles was very prevalent, and defective drainage is reported in connexion with some deaths from scarlatina that occurred there. Four children died in one family at Kessingland from diphtheria. In the districts of Yarmouth and Norwich the mortality was very high. In the latter, and also at Wells, measles was exceedingly prevalent.

The South Western Counties, with a population of 1,835,714, rather less than that of the South Eastern, exhibits higher returns both of births and deaths. But though the former division was not so healthy as the latter, it was apparently healthier than usual, for there was a decrease of deaths in each of its five counties, although small-pox attacked Exeter, Totnes, Plymouth, Liskeard, St. Austell, Truro, and Taunton. The registrar of Totnes describes the increase of this disease as "almost alarming;" and at St. Clement, Truro, "the deaths were greatly in excess of the average; small-pox prevailed to a great extent and proved fatal in many cases." In this sub-district public vaccination had been greatly neglected; it is stated that a whole period of a year and a half elapsed without the performance of a single vaccination by the public vaccinator. Of 134 deaths in Bedminster (sub-district) no less than 54 were from measles.

The West Midland Counties. Population 2,436,568. The deaths were 12,721, showing a decrease on the numbers in two previous springs. They were to the births in the proportion of only 12 to 22. Measles was the prevailing complaint in this division, and it raised the mortality at Bristol and Clifton. In St. Philip and Jacob (Clifton) it was fatal in 12 cases in May and 39 in June. It was reported also at Stow-on-the-Wold; at Munslow, Pontesbury, and Wombridge in Shropshire; at Dudley in Staffordshire; at Belbroughton (Bromsgrove) in Worcestershire; at Birmingham and Deritend (Aston) in Warwickshire. There were 22 deaths from scarlatina at Horsley (Stroud); and diphtheria has been very prevalent at Ellesmere, and caused a fourth part of the mortality in that sub-district.

The North Midland Counties contain a population of 1,288,928, which, though not quite equal to that of the South Midland, registered a higher number of deaths, namely, 6962 in the former division against 6484 in the latter. The same remark applies to the births. There was no decrease of deaths in any of the five counties except Nottinghamshire, and in this instance the result did not, apparently, flow from better health, but from want of employment which thinned the population of some parts. Measles prevailed in Leicester, and of 458 deaths 99 were from that disease, which also in a very malignant form attacked the children in Boston workhouse. It was fatal also in Derby. Eight out of 52 deaths were from diphtheria in Caistor in Lincolnshire; 5 of these at North Kelsey.

North Western Counties. Population 2,935,540. Deaths in the quarter 17,576. It is a fact well worthy of notice that Lancashire with a population less than that of London by about 338,000, and living on an area nearly seventeen times as large, returned almost as many deaths as the metropolis, for the difference was only 171. If sanitary work is still to be done in London, it is evident that the want of it is exceedingly urgent in the seats of manufacture and commerce in the north. There were 4 deaths from diphtheria at Barrow, a village near Chester; and this complaint, with scarlatina, which prevailed in ill-ventilated and over-crowded cottages, caused 11 deaths at Bollington in the district of Macclesfield.

In Yorkshire, with a population of 2,015,541, the deaths were 11,576. The village of Seaton Ross in the East Riding suffered much from malignant scarlatina. Measles carried off many children in Guisbrough. The bad ventilation of the lead mines in the parish of Arkengarthdale in the North Riding has, as the registrar believes, affected the health of the workmen.

In the Northern Counties 6575 deaths occurred in a population of 1,151,281. Of 180 deaths in Hartlepool 35 were from scarlatina, which also invaded Gateshead, Durham, Stockton, and Hexham.

Monmouthshire and Wales have a population of 1,312,834; and they returned 7480 deaths in the quarter. The health of this division generally appears to have been good. The mortality was comparatively high in Aberystwith, Wrexham, and St. Asaph.

Third Quarter.—July, August, September, 1861.

Returns have been obtained of marriages in the first nine months of the year, and they show that if the progress of population is taken into account the number of alliances formed was low during the whole of that period. The children born in the September quarter decidedly exceeded the number which the average birth-rate for the same period would have produced; whilst the rate of mortality in the same three months, though it differed little from, was not so high as the average rate for that season, which is the healthiest of the year. This statement exhibits the most prominent features of the Return.

Marriages.—Of persons who married in the summer quarter (the third) the number was 79,768. As compared with those for the same period in 1860, the returns of all the eleven divisions show a decrease, except those of the south-eastern counties, the south-western, Yorkshire and the northern counties. Marriages were few in Northamptonshire, numerous in Cornwall, few in Staffordshire, Derbyshire, and South Wales, numerous in Durham and Northumberland.

The marriage-rate was 1·57 per cent. against the average rate, 1·62. It has rarely been so low as it was in the summer quarter of this year.

Births.—There were 172,133 children born in the summer quarter (ending Sept. 30th). In the summer of 1860 the number was 164,121. The annual birth-rate derived from ten summers is 328 for ten thousand of the population; in this quarter it was 339. Comparing the two quarters of 1860–61, and viewing the numbers absolutely and without reference to the increase of population, it appears that there was an increase of births in all the eleven divisions, except that of Monmouthshire and Wales in which they were stationary. But this division would have furnished no exception to the rule of increase, if the character of its returns in their aggregate were not unfavourably affected by Merthyr Tydfil, Bridgend, Swansea, Newcastle-in-Emlyn, and Crickhowell in South Wales, in which parts a decrease has occurred both in marriages

and births, chiefly perhaps in consequence of the migration of persons connected with the industrial operations of those districts.

Liverpool with a population of 269,742 produced 2158 births, whilst Manchester with a less population, 243,988, returned 2278. In London the births in the quarter were 23,597 ; in Lancashire they were 23,201.

Increase of Population.—The natural increase of population is the excess of births over deaths in a given time. This excess was 70,901 in the quarter, or an average of 771 in a day. The natural growth is weakened or strengthened by migration.

In the quarter 19,892 persons left ports in the United Kingdom, at which there are Government emigration officers. Of these, 6348 went to the United States, 4930 to the North American Colonies, 7100 to the Australian Colonies, 1514 to other places. Of the total number of emigrants 8942 were of English origin, and of these a large proportion chose the Australian Colonies. The Scotch preferred the North American Colonies to the United States.

In the summer quarter of 1851, the total number of emigrants from the United Kingdom to the United States was 68,931, in that of last year it was 21,104, and in the present year the number for the quarter declined to 6348. British North America has received a certain number of those, who would have preferred the United States in a more peaceful time ; but a great majority have decided to remain at home.

Prices, the Weather, and Pauperism.—The average price of consols in the quarter fell to $91\frac{3}{8}$. The average price of wheat per quarter was 52*s.* 1*d.*, which is less by 7*s.* than it was in the same quarter of 1860, but higher by 8*s.* than in that of 1859. Both beef and mutton are cheaper than they were at the same time in 1860. The average price of the best potatoes has fallen in the same periods from 135*s.* per ton to 97*s.* 6*d.*

The meteorological character of last summer was so far different from that of the summer which preceded it, that its mean temperature at Greenwich was 60·4°, having been higher by 4·2°. Till August 3d, the temperature of the air was generally rather below the average ; warm weather set in on the 4th, and continued thirty-nine days ; from September 12th till September 27th, the weather for the most part was cold. On August 12th the mean temperature was 72·9°, nearly 12° in excess of the average, and higher by 10° than the highest mean temperature in 1860. On the same day the thermometer in the shade rose to 89·5°, or 13° higher than the highest point in 1860, which was 76·5° on May 23d. The temperature of the last day of September was remarkable ; the mean was 61·5°, and the highest 74° ; and going back as far 1814, this is the only instance in which the mean temperature of September 30th, reached 60°. Hardly more than half an inch of rain fell in August ; the total fall in the three months was $4\frac{1}{4}$ in., which is $3\frac{1}{4}$ in. below the average of forty-six summers. In July the weather was unsettled all over England ; in the other months it was very fine, with little rain in some parts ; but unsettled with much rain in others. For these and other interesting facts, stated in greater detail, Mr. Glaisher's Report, which is subjoined, may be consulted.

The Registrar of Poulton-le-Fylde, in Lancashire, mentions that the crop in his district was nearly an average, and had been secured in excellent condition. The Registrar of Pudsey (Bradford), attributes the health of his district to fine weather and wholesome food " at a moderate price." The Registrar of Northallerton states that the season has been very favourable, and " the crops well got in ;" and the report from Chester-le-Street in Durham is, that the produce is abundant and gathered " in prime condition." The Registrar of Kington, in South Wales, says :— " Weather unusually warm, and harvest completed in excellent order ; the crops light, but of good quality." At Bettws-y-Coed in North Wales

the weather was very wet in July, but the two other months "rather fine;" but in West Ward, Westmorland, "since the middle of July the weather has been extremely wet and changeable."

The returns of pauperism, which were heavy in the early part of the year, continued heavier in the summer quarter than they were in the same period of 1860.

State of the Public Health.—The number of deaths registered in the three months was 101,232, or considerably more than in the summer quarter of 1860, which was 86,312, but less than in that of 1859. And over England the fluctuation in the deaths was generally similar to that which is shown in the aggregate number. The annual rate of mortality did not rise quite to the average; for the former was 199 in 10,000 of the population, the latter is 202. In the cold September quarter of 1860 the rate was 172.

The mortality in the country and small towns was 175, whereas that of the large towns was 219. The respective average rates are 172 and 230. Whence it appears that in an equal number of the population (10,000) there were 44 deaths more in towns than in country; but the health of the former was better this quarter, relatively to their own former experience, than that of the latter, for the mortality amongst the rural population slightly exceeded its average.

The town and country rates of mortality in the summer of 1860 were respectively 184 and 157. That season differed from the summer which has just passed chiefly in this respect, that it was much colder, and consequently diarrhœa prevailed much less than it has recently done. In 10,000 persons the excess of deaths this year over those of 1860, was 35 in towns, and 18 in the country. Other causes besides diarrhœa affect in various ways the results; but the facts are sufficient to show that this complaint rules with a more deadly effect in towns, "where houses thick and sewers annoy the air." It deserves to be noticed that the annual deaths from diarrhœa in London ranged from 452 to 841 in the years 1840–5; they suddenly mounted to 2152 in 1846; they continued high during the whole period 1847–59, which embraced two cholera epidemics; they were 3335 in 1859, which is more than a sixth part of the deaths from diarrhœa that year in England. They fell to 1383 in 1860. When an efficient system of drainage has come into operation in London and the large towns, and other sanitary works have sweetened the air above and the earth beneath, the permanent reduction of diarrhœa will be, it may be hoped, among the good results that will be gained; but that improvement "at home," which is so much needed by the poor, increased comfort in their dwellings and order in their habits, better food and purer drink, will probably be still more effectual in abating that disease by which so much infant life is yearly destroyed.

Amongst public sanitary undertakings by which periodical outbreaks of diarrhœa and other diseases are to be encountered, there is none of more hopeful character than the introduction into towns of water pure and ample. An eminent statesman, to whom municipal institutions are greatly indebted, has declared that the erection of public drinking fountains should engage the attention of municipalities and other representative bodies, which have the power of levying the local rates. It must be still more an object of concern to establish its circulation within the houses of all classes of the community. And if the purity of Loch Katrine cannot be attained, it is still possible by improved mechanical means to reduce the contrast, far too palpable as it exists at present, between much of the water supplied to towns and that of the model Highland reservoir.

An increase of deaths in Strood (Kent) was due to dysentery and scarlatina; and the Registrar remarks that "in a district having a large marsh surface, there will always be some autumnal dysentery, especially

when the season is warm and dry, as this quarter was in a remarkable degree."

Diarrhœa is reported as having been prevalent and fatal in Manchester, Salford, Liverpool, Sheffield, York, Yarmouth, Norwich, and many parts both of town and country. Of 291 deaths in the Deansgate sub-district of Manchester, 73 were caused by infantile diarrhœa. Some observations on the subject by Mr. Leigh will be found in their place in the *Registrars' Notes.* Of 254 deaths in the sub-district of Regent-road, Salford, 61 were from diarrhœa. In West Wymer, Norwich, the same complaint was fatal in 50 cases in a total number of 177 recorded; at Deritend (Aston) in Warwickshire in 59 cases out of 187.

Low typhoid fever is very prevalent at Steyning in Sussex, where in consequence of bad drainage it is believed to cling with greater tenacity. The total deaths in Brighton were 427 against 342 in the same quarter of 1860. Fever prevails in the more crowded parts of the town of Buckingham, where drainage and ventilation are stated to be very imperfect. At Worcester, where there has been a great deal of typhoid fever, almost every case has been accompanied by "pustular eruption or ulceration of the throat, which sometimes became almost diphtheritic." Typhus carried off a man, his three adult sons, and his grand-daughter, who occupied two houses at Snitterfield (Stratford-on-Avon). It was very prevalent, though not very fatal, at Yeadon in the West Riding of Yorkshire.

Of 29 deaths at Somersham (St. Ives) 9 were caused by diphtheria; and of 31 at Ixworth (Thingoe) in Suffolk there were also 9 (in Great Livermere parish) from the same disease. It was fatal in 7 cases in Holt, Norfolk. Five deaths, all in one family, occurred from it at Burnham in the same county; and in the neighbouring sub-district of Snettisham "a malignant form of sore throat" is very prevalent, of which more than 30 cases (6 fatal) occurred in the parish of Hunstanton. Diphtheria raised the mortality at Loddon and Diss. It was fatal in 6 cases at Ellesmere. It prevailed greatly at Leake in Leicestershire, and it caused 5 deaths out of 26 at Holt (Wrexham) in North Wales.

The registrar of the Dale-street sub-district, Liverpool, complains both of its moral and sanitary condition, and draws attention to the following comparison, which is sufficiently striking:—In his own sub-district, containing a population of 29,078 persons, there were 266 births and 236 deaths in the quarter. In the sub-district of West Derby, with a population of 52,740, there were 497 births and only 208 deaths. The registrar of the more favoured locality partly explains the cause of so great a difference; he writes:—"There have not been so few deaths (in West Derby) in any "quarter since that ending June 30th, 1856, though the population is "now from twelve to fourteen thousand more than at that period, which "proves that the inhabitants are in an unusually healthy state, owing in "a great degree to the great care taken by the authorities of Liverpool "in cleansing the streets, sewers and courts." It may be inquired whether the same watchful and beneficent care is not extended by the Liverpool authorities to the Dale-street district, where it is stated that ashpits are an abounding nuisance. The authorities in charge of this locality will not plead the want of successful example as an excuse.

The report from Salisbury is as cheerful as that of West Derby. It runs as follows:—

"The deaths are much below the average, which can only be accounted "for by reference to the sanitary measures that have been adopted within "the last few years. The city is thoroughly drained, running streams in "every street called canals are covered over, and a supply of better water "is obtained. The beneficial effects of these measures are now beginning "to be felt."

Fourth Quarter.—October, November, December, 1861.

The marriage-rate, which had been low in the preceding nine months of 1861, continued rather low in the last quarter of the year. The birth-rate was not high in the first quarter of the year, but it rose above the average in the spring, continued above it in summer, and slightly exceeded it in the fourth quarter. There was no great amount of fatal sickness; for the mortality was below the average in each quarter of the year 1861.

Marriages.—The number of persons married in the December quarter was 97,072; the total number in the year was 327,412. The marriage-rate of the quarter was 1·906 against an average of 2·000; the marriage-rate of the year was 1·628 against 1·693.

In London the marriages in the quarter were 7333; in the north-western counties (Cheshire and Lancashire), which contain a rather larger population than London, the number was 7087. While the metropolis maintained its marriages, as compared with those of the corresponding quarter of 1860, Lancashire reported a considerable decrease, for in the two corresponding quarters the numbers in that county were respectively 6835 and 6078. It was stated in a Registrar's report from Lancashire,

The following are the names of the 139 Districts and 56 Sub-districts comprising the CHIEF TOWNS:—All the 37 Districts of London; Croydon, Kingston, Richmond, Gravesend, Medway, Tunbridge; *West and East Maidstone Sub-districts* (Maidstone); Canterbury; *Minster Sub-district* (Sheppey); Thanet, Dover, Hastings, Brighton; *Shoreham Sub-district* (Steyning); Portsea Island, Alverstoke, Southampton; *Winchester Sub-district* (Winchester); Reading, Brentford, Edmonton; *St. Clement Sub district* (Headington); Oxford, Northampton; *Peterborough Sub-district* (Peterborough); *Bedford and Kempston, and Bedford and Cardington Sub-districts* (Bedford); *Luton Sub district* (Luton); Cambridge, West Ham, Colchester, Bury St. Edmunds, Ipswich, Yarmouth, Norwich, King's Lynn, Melksham, Salisbury; *Weymouth Sub district* (Weymouth); Exeter; *Torquay Sub-district* (Newton Abbott); Plymouth, East Stonehouse, Stoke Damerel, Truro, Redruth; *St. Mary Magdalen and St James Sub-districts* (Taunton); *Bridgwater Sub-district* (Bridgwater); Bath; *Bedminster Sub-district* (Bedminster); Bristol, Clifton; *St. Nicholas and St. John Baptist Sub-districts* (Gloucester); Cheltenham; *Hereford City Sub-district* (Hereford); Madeley, Shrewsbury; *Stafford Sub district* (Stafford); *Newcastle-under Lyme Sub-district* (Newcastle-under-Lyme); Wolstanton, Stoke-upon-Trent; *Burton-on-Trent Sub-district* (Burton-on-Trent); Wolverhampton, Walsall, West Bromwich, Dudley, Stourbridge; *Kidderminster and Lower Mitton Sub-districts* (Kidderminster); Worcester, Birmingham, Aston, Coventry, Warwick; *Loughborough Sub-district* (Loughborough); Leicester; *Boston Sub-district* (Boston); *Lincoln Home Sub-district* (Lincoln); *Great Grimsby Sub-district* (Caistor); Radford, Nottingham; *Newark Sub-district* (Newark); Derby, Hayfield, Stockport; *East and West Macclesfield and Sutton Sub-districts* (Macclesfield); *Runcorn Sub-district* (Runcorn); *Congleton Sub-district* (Congleton); *Chester Castle and Chester Cathedral Sub districts* (Great Boughton); Birkenhead, Liverpool, West Derby, Prescot, Wigan, Warrington, Leigh, Bolton, Bury, Barton-upon-Irwell, Chorlton, Salford, Manchester, Ashton, Oldham, Rochdale, Haslingden, Burnley, Blackburn; *Chorley Sub-district* (Chorley); Preston; *Lancaster Sub district* (Lancaster); Keighley, Todmorden, Huddersfield, Halifax, Bradford, Hunslet, Leeds, Dewsbury, Wakefield, Barnsley, Ecclesall Bierlow, Sheffield; *Doncaster Sub-district* (Doncaster); *Bootham, Micklegate, and Walmgate Sub-districts* (York), Sculcoates, Hull; *Scarborough Sub district* (Scarborough); *Darlington Sub-district* (Darlington); Stockton, Hartlepool; *St. Oswald and St. Nicholas Sub districts* (Durham); Houghton-le-Spring, Sunderland, South Shields, Gateshead, Newcastle-upon Tyne, Tynemouth; *St Cuthbert and St. Mary Sub districts* (Carlisle); *Whitehaven Sub-district* (Whitehaven); *Kendal Sub-district* (Kendal); *Newport Sub district* (Newport); *Cardiff Sub-district* (Cardiff); Merthyr Tydfil; *Llangafelach and Swansea Sub-districts* (Swansea); *Llanelly Sub-district* (Llanelly); *Pembroke Sub-district* (Pembroke).

Note.—The three months January, February, March, contain 90, in leap year 91 days; the three months April, May, June, 91 days; each of the last two quarters of the year, 92 days. For this inequality a correction has been made in the calculations, also for the difference between 365 and 365·25 days, and 366 and 365·25 days in leap year.

made at the end of this year, that "the demand for labour in the cotton "factories and the market generally had been fully a third below the "average." The midland counties and Yorkshire also exhibited a decrease in marriages.

To take a few towns for examples of decrease: In Manchester marriages declined from 1285 in the last quarter of 1860, to 1150 in that of 1861; in Ashton from 342 to 271; in Blackburn from 412 to 281; in Preston

from 355 to 254; in Stockport from 332 to 218; in Bradford from 575 to 483; in Sheffield from 601 to 470; in Nottingham from 252 to 208.

The marriages of all England declined, but in some places there was an increase. In the district of St. George Hanover-square they rose from 235 to 290; in Wakefield from 117 to 141; in Tynemouth from 146 to 181.

Births.—The total number of children born in the last three months of the year was 166,620. The fourth is that quarter in which births are usually the fewest. The birth-rate was 3·27 per cent., whilst the average for the quarter is 3·23. It was high in Lancashire, Durham, Northumberland, and Cumberland.

Increase of Population.—The natural increase of population is the excess of births over deaths. This excess as exhibited in the registers is 61,511 in 92 days, or about 669 daily.

In the quarter 16,559 emigrants sailed from ports in the United Kingdom at which there are Government emigration officers; and of these 8068 were of English origin. 1604 of the English people went to the United States; 5916 to the Australian Colonies. In the smaller emigration of the Scotch the preference for Australasia received a still more striking development, whilst the Irish divided themselves into forces, not very unequal, between the two destinations. By comparing the returns for the December quarters it appears that emigrants to the United States were about 52,000 in 1851; from that point the number fell by a great but not constant decrease; it was about 40,000 in 1853, little more than half that number in 1856, about 15,000 in 1860, and the exact number last quarter was 5698.

The total number of emigrants to all parts in 1861 was 91,770, of which more than half went to the United States. The Irish element

constituted considerably more than half of the emigration to the United States, but it suffered a great reduction towards the close of the year; for the Irish emigrants to that portion of the globe were about 37,000 in the year, but about a fifteenth part of that number in the December quarter.

In the total emigration of 1861 the proportion of unmarried adults to the married was rather less than 3 to 1.

Prices, the Weather, and Pauperism.—The average price of consols was $93\frac{3}{8}$; it had been $91\frac{6}{8}$ and $91\frac{3}{8}$ in the previous quarters of the year. Wheat was 59*s.* 3*d.* per quarter; it was dearer than in the same period of 1860, and dearer by 16*s.* than in that of 1859. The means of the highest and the lowest weekly prices of mutton have not varied in the last three December quarters. Beef of the inferior quality was dearer than in the corresponding quarter of 1860. The mean price of the best potatoes was 120*s.* per ton.

Mr. Glaisher writes in his "Remarks on the Weather" that we must travel back to 1831 for an October so warm as the last, and then back to 1811 for a second example. At Greenwich the mean temperature of last October was 5° in excess of its average. A marked change took place on 1st November, and the weather was cold on almost every day till the 24th. The 18th of November was singularly cold; its temperature was below 32° the whole day, and the mean was as much as 15°·1 below the average of the day. Another great change followed on the 25th, and a warm period which began on that day continued till the 24th of December. The year closed with cold weather. The fall of rain in November (5·2 inches) was the greatest fall in that month for 45 years, with only one exception. The total fall in 1861 was 20·8 inches. At Truro in the same time it was 39·9 inches; at Lampeter 43·9 inches; at Stonyhurst 39·6 inches; at Allenheads 51·7 inches.

The returns of the Poor Law Board exhibit a heavy increase of paupers. The number relieved in-door was 128,533, against an average in the previous two December quarters of 112,392; those who received out-door relief were 716,096, against an average of 679,088.

State of the Public Health.—The total number of deaths registered in this quarter was 105,109; it was not so great as in the same quarter of 1859, but greater than in that of 1860. It will be seen in the Tables that the deaths as returned for this quarter, and distributed in the eleven divisions of England and Wales, are less numerous than they were in 1859 in all of these divisions, with the exception of the north-western and the northern. The excess in the latter division is unimportant; that in the north-western counties is considerable, and arises from a higher mortality in Lancashire. The population of Lancashire is less

than that of London by about 340,000, and lives on an area seventeen times as large, but the number of deaths which it returned this quarter was 16,709, while that in London was only 16,173. The deaths in Lancashire were about 2000 more than in either of the two previous December quarters. In Manchester they were in the three corresponding periods successively 1743, 1682, 2123. Amongst other places in the same county that discover an increase may be mentioned Liverpool and West Derby, Wigan, Leigh, Bolton, Chorlton, Salford, Blackburn, and Preston. There was a decrease in Rochdale.

The death-rate for England and Wales this quarter was 2·064 per cent. of the population, the average being 2·182. Within eleven December quarters the maximum has been 2·4; the minimum 1·997.

The population that dwell in the larger towns suffered a death-rate of 2·3; that of country parishes and small towns a rate of 1·8. The difference may be stated thus:—If the mortality of this quarter prevailed for a year, a proportion of the persons who inhabit towns, equal to five in a thousand, would die, who would survive the close of the year if their lot had been cast amongst a rural population.

But relatively to the standard furnished by the experience of former years in each of the two classes, the urban population obtained, or, by the successful application of sanitary science, achieved, a greater reduction of the mortality than that which was obtained in the rural districts. In the former, from an average of 2·5 the rate was reduced to 2·3; in the latter it fell from 1·9 to 1·8.

In this Quarter, fever under various designations, typhus, typhoid fever, low continued fever, and scarlatina, prevailed extensively, and in many parts of the country. In Sussex, Rotherfield, East Grinstead, Steyning, and Horsham suffered from typhus or typhoid fever. Of 53 deaths at Steyning (sub-district) nearly a fourth part was from the latter disease. A family at East Grinstead, who occupied a new house imperfectly drained, was attacked; seven inmates, the entire household, were ill; five died. At Alverstoke, in Hampshire, out of 122 deaths 10 were from typhoid fever. At Isleworth four women lay dead, all at the same time, from puerperal fever. At Colliers End in the parish of Standon, Hertfordshire, some drains are allowed to remain in a filthy condition, and there scarlatina broke out and raged fatally. Typhus prevailed in the same county at Lemsford, Ashwell, and Therfield. The two former places are in a bad sanitary state; and Therfield is unfortunate in the quality of its water. Scarlatina was fatal at Aylesbury. There was much typhus or typhoid fever at Higham Ferrers, Peterborough, Helpstone, and Peakirk, in Northamptonshire; supposed to have arisen from nuisance in the two latter places. There were 30 cases of it, 4 of which were fatal in Pidley,

Huntingdonshire, where the villagers are obliged to drink unwholesome water "out of ponds or pits." It prevailed also at Sutton and Chatteris in Cambridgeshire; at Woolpit in Suffolk; at West Ham, the town of Chipping and its neighbourhood, in Essex, where it attacked eight persons who lived in one house; at West Flegg, Trowse Newton, South Walsham, Pulham Market, Wells, and Blakeney in Norfolk. An instance is recorded in which 7 deaths occurred from typhus in one cottage. The enclosure of a large salt marsh at Wells, bad drainage, and the neglected state of poor dwellings, are believed to have doubled the mortality in that sub-district. Scarlatina was very fatal at Salthouse, also in Norfolk, where the poor suffer from crowding, the want of ventilation and other elements of good condition. Typhus raged at Mere and Boyton in Wiltshire, and at Gunnislake, a village in Devonshire, which in many parts (says the Registrar) is "terribly overcrowded," while ventilation and drainage are very defective. The same disease or a mild form of it was more or less fatal at St. Clement (Truro), St. Just in Penwith (Penzance), and in Somersetshire in the sub-districts of Banwell and Keynsham. In the parish of Church Gresley, Staffordshire, where stricter attention to sanitary measures is required, continued fever has been fatal. Many deaths occurred, also, from fever in Darlaston (Walsall). Many families in the county have changed their abode in consequence of the state of the iron trade. Typhus had increased at Leicester; it prevailed at Nocton and in Misterton in Lincolnshire. The sanitary condition of certain parts in the district of Lincoln is stated to be "very bad." Typhus and continued fever prevailed in the district of Basford; the drainage at Ilkeston being defective. The lace trade was in a state of depression. There was fever in Belper and Hayfield in Derbyshire. The township of Bollington (Macclesfield) has been very unhealthy the whole year. There were 50 deaths in it this quarter, 22 of which were from typhus and scarlatina. Fever was chiefly fatal in houses where are cesspools or heaps of rubbish, or where the drainage is bad. Of 27 houses that form a street in Bollington only two or three escaped the infection. Typhoid fever prevailed in Weaverham (Northwich). Of 86 deaths in Over 43 were from scarlatina. Fever was very common in Woodchurch (Wirrall). Macclesfield has reaped the benefit of extensive improvements in a reduction of the mortality. The sub-district of Darwen (Blackburn) in Lancashire suffered from typhus, which was fatal in 41 cases. The same disease was very severe in Yeadon, Yorkshire, and "a great many persons were afflicted with it." The prevalence of typhoid fever in Slaithwaite (Huddersfield) induced the local authorities to have recourse to sanitary means for its suppression. At Meltham, in the same district, "the unhealthy state of the atmosphere" was supposed to be the cause of the disease. But the town of Halifax enjoyed excellent health, and

* Approximated to the results of Robinson's Anemometer by reductions from Whewell's.

"almost uninterrupted employment"; it has on the whole good drainage, and an unbounded supply of pure water. An increase of births and a decrease of deaths were the results. Elland Edge, in the same district, was less fortunate, for both typhus and measles prevailed there. Bradford was healthy, its sanitary condition having been improved, provisions, with the exception of meat, being cheap, and the working classes generally employed. But fever in various forms was unusually fatal at Bramley, where the depression of trade has caused much suffering, and an imperfect sanitary condition has drawn the attention of the Town Council of Leeds. Typhus has been very fatal at Morley (Dewsbury), and scarlatina in Castleford (Pontefract), which township is in some parts without a proper system of drainage. The latter disease, in a very malignant form, has raised the mortality of Market Weighton (in the East Riding) and the adjoining village of Goodmanham. The deaths in the parish of Coyton near Scarborough were numerous "from scarlatina and other infectious diseases," which the registrar believes to have arisen from bad drainage. "Pumps locked up," "piggeries and cowsheds" emptying themselves in the street, "a stench intolerable,"—these fill up a sketch which does not flatter, and, if it be true, ought not to offend. Typhoid fever has been prevalent in the villages of Beadlam and Nawton (Helmsley), which are ill-drained, and have bad water. Low fever prevailed at Marske (Guisborough). Scarlatina has been severely felt in many parts of Durham, Northumberland, and Cumberland. Typhoid fever prevailed in Middlesborough (Stockton); in part of the town, especially, that has been recently built. Blaydon, in the district of Gateshead, which is often infested with scarlatina, "is below the flood marks, and some of the houses have been filled to the ceiling of the lower rooms during the autumn." At Keswick, where the weather was wet, and sanitary arrangements "not quite complete," typhoid fever has been common, and in some cases fatal. The villagers of Pill (Milford) in Wales suffered much from typhus; it was fatal in Brymbo, where, as well as in the town of Wrexham, it is stated that the conditions of health have been hitherto much neglected.

Dr. Acland, the Regius Professor of Medicine in Oxford, has favoured the Registrar General with the following observations on the fever in that city, and in the region extending over the Thames basin:—

"It must be admitted that the ground on which Worcester College [where two fatal cases of typhoid fever were registered] is situated is low, and not well drained; but the same may be said of a great part of the city. Our drainage has not yet been put on a systematic footing; there are still whole streets using cesspools; still the sewage is cast into the streams; still we have an inadequate outfall; still the periodic floods infiltrate the subsoil, fill cellars in the lower streets, and by that infiltration and filling mix the exudations from old cesspools with the surrounding mould.

"All this is well known here, and many improvements in details have been made; but the best minds are well aware that in this district a larger measure than mere local improvement is required to work a thorough cure, and they are therefore not eager to promote lesser plans, which they know will prove ineffectual.

"The fact is *the drainage of the whole Thames valley above Teddington Lock ought to be in the hands of a Government commission;* there would then be some hope,

"1st. That the towns on its banks would be induced to adopt the best known system for disposing of their sewage:

"2d. That the upper Thames waters would be made as pure as possible, for the use of the metropolis:

"3d. That the waters would be so regulated as to be quickly let off when accumulating, and retained at a proper level when falling:

"4th. That the death-rates on the banks would be diminished.

"Drainage works have long been in progress in many parts of the upper Thames and its tributaries. Under the Act of last session these will probably be increased, but they have not been nor are likely to be on any large concerted plan, nor on any uniform method. Great opportunities have been lost of buying up mills, of regulating locks and dams, and of making use of railway operations for controlling the streams.

"This is greatly to be regretted, because it may be safely assumed that, were the river and the lands near it under sound management, not only would the death-rate of some districts be diminished, but the commercial value of much meadow land be increased.

"The latter consideration you may no doubt leave to landowners and capitalists; the former deserves your serious attention. A more thorough inquiry into the sanitary condition of this whole upper Thames valley than has yet been made would be both valuable and interesting. In constant and most obliging intercourse with the members of my profession over a considerable area, I have gathered many facts concerning the health of towns and villages and districts along the banks of the upper Thames; they are often curious and perplexing. They could be tested,—and a most instructive inquiry it would be,—only by a systematic investigation of the course of the river and its tributaries.

"I am inclined to think on the whole that it would appear,

"1st. That the working health of whole districts, and especially of Oxford, would be improved by proper river management, and a general system of drainage:

"2d. That sometimes the flat parts, sometimes the slopes adjoining the flats, and sometimes the heights are the most unhealthy:

"3d. That the soil modifies in a high degree the effects of the surface waters; a low place near the river, being on gravel, may be quite healthy, when a place further off, and higher, but on another soil, shall have continuous crops of fever:

"4th. That in considerable areas ague has been very prevalent in the memory of man, and is now unknown; low fever (mild typhoid) having taken its place:

"5th. That in the spots last named further sanitary improvement would eradicate a great deal of the fever, and of the tubercular diathesis:

"6th. That in estimating the condition of these localities we must always consider the habits, clothing, food, dwellings, and wages of the people, as well as the drainage and exhalations from the soil:

"7th. That while no doubt the register of the deaths is a true test of the health of these regions, yet the physician sees, or thinks he sees, feeble power, tardy convalescence, distress and discomfort incalculable, which are not fully expressed in the death-rate, and which would also be relieved as it (the death-rate) diminished.

"The way to test these propositions would be to make a careful examination, in the main valley and its tributaries, of the villages and towns on all the alluvial levels, on the slopes, and on the heights; noting the nature of the soil geologically; and to compare on the spot your registration returns for certain periods with the local knowledge thus acquired. The results would often be quite different from what would be expected. It would not be a very difficult undertaking, with the help of your office, and of the union medical officers.

"The truth is we ought to have such knowledge for all England; but I now press this restricted inquiry on your attention for two reasons, first, because it is feasible, from its limited and distinct nature, and,

secondly, because it would tend to purify and regulate part of the water supply of London.

"Why the Londoners do not rise up in arms against us provincials for remorselessly pouring our sewage down upon some of their water companies, is a standing marvel. We may now assume that the elements of disease are carried in water; through what distance we do not know. Ordinary prudence should therefore keep the upper rivers above great towns as pure as is practically feasible."

Health of London in 1861.

When the Census was taken on April 8th, 1861, the population of London was 2,803,989. If the rate of increase, which prevailed in the decennial period 1851–61, continued to govern its progress, the population enumerated received an accession of 11,149 by the middle of 1861, and the total number became 2,815,138.

In the ten years that intervened between the last two censuses the amount of increase of the London population was equal to 121 daily. But its natural increase, viz., the excess of births over deaths, did not much exceed 72 daily; whence it follows that nearly fifty persons on an average arrived and settled each day in the metropolis over and above that unascertained number of settlers who only stepped into the places of persons who left it for parts in these islands beyond its bounds, or for more distant regions of the globe.

Whether London is equal to the task of providing by new and improved arrangements for this constant accumulation of human beings within its limits still remains to be determined by experience. When a family increases in its narrow lodging, in circumstances of dirt and squalor, that increase which should be its blessing becomes its bane; and at last fever destroys what slow disease may have spared. And in a city or a state the growth of its population is not a strength to be trusted, but a weakness to be feared, if improvement in its physical and moral condition is not commensurate with the growing urgency of its wants.

Two distinct outbreaks of cholera, which made havoc in many families and struck terror into all, and the brief but fatal eruption of influenza in 1847, furnish the most remarkable passages in the sanitary history of the metropolis during the last twenty years; but they cannot justly be regarded as its worst features. Other diseases, more frequent in their recurrence and persistent in their character, and also more wasteful in their effects, mark the whole period. Heavy bills of mortality forced public attention; and in the course of these years important

measures for the improvement of the public health have been undertaken, and some proof that they have not been unfruitful has been obtained. Health officers have been appointed for the city of London, for Marylebone, and the other metropolitan districts. Inspectors of nuisances have acted in co-operation with them. Drainage works have been carried out, and are in progress. The water companies obtain their supply at higher positions in the river, and subject it to improved filtration. The markets are inspected, and attempts made, with partial success, to protect consumers against unsound meat and noxious, fraudulent compounds. Hospital accommodation is extended; and, what is of prime necessity, the working classes have probably become more awakened to the care of their own health,—to the importance of keeping their dwellings sweet and dry. This task, which is imposed on the people themselves, and can only be performed by them, it is the object of police regulations to render possible; and unless it is fulfilled, public works will comparatively little avail. Altogether there is abundant proof of that increased regard for human life that attends civilization; and though much remains to be accomplished, it is true, according to the proverb, that "a work begun is half done."

In the ten years 1840–9, the mean rate of mortality in London was 2·51 per cent.; in the subsequent decennium, 1850–9, it fell to 2·36 per cent. It is still more satisfactory to observe, that the rate of mortality *in each of the last three years*, 1859–61, has been less than the lower of the two rates that have just been mentioned. In 1860 the rate was 2·26; in 1861 it was 2·32. If the mortality of London were confined permanently within the limit represented by the mean rate of the last three years, the effect of that reduction in the population as it exists at present would be that more than 4000 persons would survive annually, whose lives would drop under the mean rate derived from the twenty years 1840–59. And if measures that have been already adopted are not relaxed, the amount of benefit will be increased, as the population that is the subject of it is increased. But a higher standard of health than any which the present tables show is possible, and, it may be hoped, will be attained.

Sixty-five thousand two hundred and fifty-one deaths were registered in London in 1861. In the March, June, September, and December quarters those thousands occurred in several proportions, which were nearly as follows:—19, 15, 15, and 16. The mean temperature of the air (49°·4) was higher than that of the preceding year (47°), and the mortality was also higher by about 3000 deaths. The two years were distinguished nosologically by a greater amount of fever in 1861, especially towards the

* See note (*) on page 83.

end of it, by the much greater prevalence of diarrhœa, and a general increase of disorders of the digestive organs. But last year the mortality from bronchitis and pneumonia was less.

There were 217 deaths from small-pox, a mortality which is less than that of the same disease in any of the last 13 years, except 1857. In 1852 and 1859 the annual deaths from it were more than 1100. Spitalfields, Mile End, Aldgate, Clapham, Deptford, and Poplar are localities where its presence was most felt. Thirty-four deaths occurred in the Small-pox Hospital, Islington.

Scarlatina was fatal in 2381 cases; diphtheria in 674. Both diseases increased towards the end of the year. Croup and whooping-cough were very fatal; but the former, like scarlatina and diphtheria, increased towards the end of the year; the latter diminished. Quinsy also rose, and with other throat complaints was most fatal in the December quarter. Scarlatina appears to have visited all quarters of the metropolis, and with considerable impartiality. Somers Town suffered much; also the Waterloo-road neighbourhood. There were 23 deaths from it in Plumstead. Camden Town, West Hackney, and Rotherhithe are districts of nearly equal population: scarlatina was the cause of 43 deaths in the first, 18 in the second, only 4 in the third. In St. George Bloomsbury it caused 37 deaths; in Fulham, which is nearly equal to it, 32; in Hampstead, with a larger population, only 4. In St. George the Martyr, Holborn, besides 36 from scarlatina, there were 23 from diphtheria.

There were 1770 deaths from typhus. It did not appear in unusual force till the latter part of the year, and therefore the total mortality was not great. Indeed it was much less than that of many previous years. The districts of West London North, Poplar, and Greenwich may be mentioned among those which suffered most from typhus. The London Fever Hospital recorded 118 deaths, whilst the total number from scarlatina and typhus in the West sub-district of Islington, including those in the hospital, was 152.

The most fatal zymotic disease in the year was whooping-cough (3548); next to it scarlatina with diphtheria; then diarrhœa (2611). In respect to the last complaint the summer quarter was as usual the season of its activity.

It may be added that nearly one out of a thousand persons living died of diarrhœa in St. Mary Paddington, Kensington Town, Hoxton, Stepney,

* For the years 1849-59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.
† By Robinson's Anemometer, adopted in place of Whewell's, which was used formerly.

Mile End Old Town, Poplar, Newington, Rotherhithe, and Plumstead. In many parts the ratio was higher.

There were 2296 deaths by violence in the year. This class of cases bears a rather larger proportion to the mortality from all causes than it did ten years ago. By comparing the three years, 1850–2, with the last three, 1859–61, it appears that while the total deaths increased in the proportion of 16 and 19, those by accident, suicide, and homicide increased in that of 16 and 21.

The number of persons last year who received fatal fractures and contusions was 752. Falls from scaffolds, and street accidents make their annual contributions to the list. When building operations are extended in all directions, and the stream of men and horses from the widening area pours through old channels into the centres of traffic, casualties of this description must increase faster than the population. The railway system extended, and reaching to the heart of the metropolis, will counteract this tendency. But an ædileship that will widen the streets, open new approaches, and prevent or quickly sweep from the streets and pavements the hideous shoals of mud and dirt that periodically cover them, will promote the public health and safety, and in an immeasurable degree the public comfort.

The number of deaths in 113 Public Institutions was 10,276, or nearly a sixth part of the whole. Of that number more than a half occurred in workhouses. Of 100 persons who shared the common fate of humanity, nine died in establishments provided by parochial rates; six in hospitals for the treatment of sick persons. In the workhouse of the most populous parish, namely Pancras, there were 487 deaths; in that of Marylebone, the third parish in respect of population, there were 450; while in the workhouse of Lambeth, which is a rather more populous district than Marylebone, there were only 299.

GREAT BRITAIN.

With the assistance furnished by the returns of the Registrar General of Scotland, marriages, births, and deaths in Great Britain are known, and results are deduced from them.

The estimated population in the middle of 1861 was 23,181,790, of which 3,062,294 inhabited Scotland. The persons in that aggregate population, who married in the year, were 184,534; the children born alive 803,442; persons who died 497,401. The excess of births over deaths, or the natural gain of the population in a year, was 306,041.

The marriage-rate was considerably lower in Scotland than in England; the birth-rate was rather higher in the smaller kingdom; the death-rate was 2·034 per cent., and therefore appreciably lower than the English rate (2·163).

The following are the results for Great Britain; persons married were 1·592 per cent. of the population; births 3·466; deaths 2·146.

Table XXVI.—Estimated **Population, Marriages, Births,** and **Deaths** in **Great Britain,** in the Year **1861.**

——	Area in Statute Acres.	Estimated Population in the *middle* of the Year 1861.	Marriages.	Persons Married.	Births.	Deaths.
England and Wales -	37,324,883	20,119,496	163,706	327,412	696,406	435,114
Scotland - - -	19,639,377	3,062,294*	20,828	41,656	107,036	62,287
Great Britain -	56,964,260	23,181,790	184,534	369,068	803,442	497,401

* The population of Scotland, as enumerated at the Census of 1861, has been used for this Table.

The average area to one person is 2·46 acres in Great Britain; it is 1·86 in England; in the sparsely peopled northern Kingdom it is 6·41 acres.

TABLE XXVII.—**Proportion** per Cent. of **Marriages, Births,** and **Deaths** to the Population of **Great Britain,** in the Year **1861.**

	ACRES TO A PERSON.	TO 100 PERSONS LIVING.			
		MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
England and Wales - -	1·86	·814	1·628	3·461	2·163

TABLE XXXIII.—**Annual Rate of Mortality** per Cent. amongst the OFFICERS and NON-COMMISSIONED OFFICES and MEN in the **Army Abroad**, in each of the Years **1858–61.** (Deduced from the Strength and Deaths as given in the two preceding Tables.)

YEARS.	OFFICERS.	NON-COMMISSIONED OFFICERS and MEN.
1858	3·513	6·701
1859	2·111	3·396
1860	1·639	2·603
1861	1·574	2·567

the deaths in it in 1861. The average strength was 122,536; the deaths were 3097.

It has been stated that the rate of mortality in Great Britain was 2·146 per cent. With an estimate of that proportion of the army abroad which belongs to Great Britain, the mortality of the whole population, inclusive of the army at home and abroad, was 2·147. In France the death rate was 2·308.

Both the marriage and the birth-rate were lower in France than they were in England, whilst the death-rate was higher. Persons married were 1·544 to a hundred of the population, whilst in England they were 1·628. Births were 2·688, against the English rate 3·461. Deaths 2·308, against 2·163.

The population of France estimated for 1861 is 36,752,565. The marriages were 283,642; the births were 987,830; the deaths 848,174. The excess of births over deaths was in France 139,656; in England 261,292 in a much smaller population.

Births and Deaths of British Subjects at Sea.

The Registrar General of Seamen has favoured me with a return, in which it appears that the number of deaths of Merchant Seamen at sea in

In the 10 years 1852-61	1,707,233	32,820	1·92

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Seamen. This return does not include seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a *passenger* dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred.

A column headed *Place of Birth* was formerly contained in the schedule, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. A column headed "Whether "supposed to be a British subject or Foreigner" might be attempted. British and Foreign *seamen* are distinguished.

When a ship is lost with all persons on board, the owners return the number and names of the crew, but not of the passengers, to the Registrar-General of Seamen.

Progress of Registration.

There were 6133 searches in the registers at the Central Office during the year. At the termination of it the Registration Act had been in operation during a period of twenty-four years and a half; and the entire number of names entered in the registers, of persons who had been married, of those who had died, and of children that had been born, the accumulated product of those years, was 30,971,551.

The success of the working of the Registration Act, like that of any other measure, must depend, to an extent that cannot be over estimated, on the character and qualifications of the officers to whom it is entrusted; and primarily it must depend on that numerous body of functionaries whose sphere of duty is external to the central office, and who are appointed to act in their respective districts, as superintendent registrars, registrars of births and deaths, and registrars of marriages; besides whom may be mentioned secretaries of synagogues and registering officers of Quakers. Certain requisites, which the persons selected to hold those offices should possess, present themselves as the most obvious and important; respectability of character, intelligence, the ability to spell with correctness, a clear and legible handwriting. Under the English Act, the remuneration which the district officers receive is probably in almost all cases only subsidiary to other means of livelihood; and that measure of success which has attended the operation of the Act is in no small degree to be attributed to the freedom it permits in the selection of those officers. The result would have been materially different if the choice had been narrowed to the medical, legal, or any other profession. The greatest diversity of occupations is found among the registrars; some are solicitors, some surgeons, some chemists; others are relieving officers, clerks, schoolmasters, farmers, dissenting ministers, parish clerks, undertakers, land agents, surveyors, auctioneers, grocers, tailors, &c. &c. It will be found in some instances, and especially in country parts where

Note.—The numbers registered in 1837 are for the Half Year ending December 31st.

population is thin, that there is difficulty in securing the services of properly qualified persons; and it is manifestly impolitic to increase the difficulty by clogging the choice of a candidate with conditions that are not essential to the right performance of the duty. In the Bill now before Parliament for registering births and deaths in Ireland it is proposed that the medical officers of dispensary districts should be the registrars. This provision is open to objection, on the grounds that have been now stated, and not less for other reasons that will suggest themselves on consideration. Undoubtedly there are medical men who act as registrars in England, and who perform the duty in the most satisfactory manner; the names of many might be mentioned; but it must be acknowledged, nevertheless, that the habits of a surgeon in good practice *tend* to disqualify him for the sedentary mechanical office of entering after careful inquiry, with measured movement, and in fine round hand, a number of particulars in the forms of a manuscript book. The "prescription-hand" is notoriously ill adapted to this purpose.

A letter by Dr. Farr on the causes of death in the year 1861 will be found in the Appendix, to which I invite your attention.

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

ANNUAL ABSTRACTS

OF

BIRTHS, DEATHS, AND MARRIAGES.

1861.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

‡ See page 6, Notes (†, ‡, §). § See page 10, Note (*). ‖ See page 12, Note (*). ¶ See page 14, Note (*).

† Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions; in these cases the two ceremonies are entered as two marriages. This column also includes 11 cases of divorce, for which see subsequent pages.

** See page 14, Note (†). †† See page 20, Note (*) ‡‡ See page 21, Note (††).

* Includes one divorced man who married a spinster.

† The township of Silsden (population 2582 in 1861) was transferred from the Keighley sub-district of Keighley (494) and incorporated with the Kildwick sub-district of Skipton (489) on 19th July 1861.

‡ The constitution of the district of Wetherby (492 *c*) was altered on 28th May 1861 by the severance of parishes and places from the districts of Otley (493 *a*), Tadcaster (514), and York (515).

§ The Kirkdeighton union or district (492 *d*) was formed, 28th June 1861, by the severance of parishes from the district of Wetherby (492 *c*).

‖ The Wharfedale union or district (493 *b*) was formed, 4th June 1861, by the severance of parishes from the Otley district (493 *a*), and of the township of Horsforth from the Kirkstall sub-district of Hunslet (500).

¶ The township of Horsforth (population 5281 in 1861) was transferred from the Kirkstall sub-district of Hunslet (500) to the Horsforth sub-district of Wharfedale (493 *b*) on 4th June 1861.

** The township of Lofthouse with Carlton (population 2028 in 1861) was transferred on 22d July 1861 from the Rothwell sub-district of Hunslet (500) to the Oulton sub-district of Wakefield (503).

†† Includes one widower who married a woman divorced.

* In the other cases the column of the Register headed "Age" is filled in by the Officiating Minister or by the Registrar of Marriages with the words "of full Age," "Minor," "Under Age," as the case may be; thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

† Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1861—*continued.*

No.	REGISTRATION COUNTIES.	AREA in Statute Acres.	POPULATION, 1861.	TOTAL MARRIAGES.	TOTAL BIRTHS.	TOTAL DEATHS.	BIRTHS. Including Illegitimate Births. Males.	BIRTHS. Including Illegitimate Births. Females.	BIRTHS. Illegitimate Births. Males.	BIRTHS. Illegitimate Births. Females.	DEATHS. Males.	DEATHS. Females.	Excess of Births over Deaths.

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 631 in number, are arranged according to their local position under the Registration Counties.

† For a table of the Deaths in the principal *Public Institutions* situated in the Districts of London *see* pages 83–4.

Note.—Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

NOTE.—The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose.

The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to *another* District or Union is included.

Wherever the minus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

The Excess of *Deaths* over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

I.—LONDON.—BIRTHS AND DEATHS, 1861—SUB-DISTRICTS—*continued.*

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a *few persons*, or *diseases* which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

No. in the Table of Diseases under which the Cases are entered.	CAUSES OF DEATH.	ALL AGES.	AGES OF MALES.

(*continued at page* 128.)

Causes of Death at different Periods of Life, in the Year 1861.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, epistaxis, piles, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120–125.]

NOTE. In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in hospitals proportionally over every district.

Population 1861, Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1861, in the DISTRICTS of England—*continued.*

II.—SOUTH EASTERN COUNTIES—*continued.*

Hull	Infirmary	110	85	77·27
Newcastle	Infirmary	171	140	81·87

3.—County and Important Provincial Hospitals.

Districts.	Name of Hospital.	Number of Special Inmates on the 8th April 1861.	Deaths in the Year 1861.	Mortality per Cent.
Canterbury	Kent and Canterbury Hospital	95	31	32·63
Brighton	Sussex County Hospital	109	72	66·06
Southampton	South Hants Infirmary	69	32	46·38
Reading	Royal Berks Hospital	72	31	43·06
Headington (Oxon)	Radcliffe Infirmary	133	33	24·81
Northampton	General Infirmary	116	36	31·03
Bedford	General Infirmary and Fever Hospital	79	18	22·78
Cambridge	Addenbrooke's Hospital	84	42	50·00
Norwich	Norfolk and Norwich Hospital	125	45	36·00
Dorchester	County Hospital	50	12	24·00
Exeter	Devon and Exeter Hospital	181	46	25·41
Bath	United Hospital	78	80	102·56
Taunton	Taunton and Somerset Hospital	54	24	44·44
Gloucester	Infirmary	91	17	18·68
Hereford	Infirmary	69	26	37·68
Shrewsbury	Salop Infirmary	101	46	45·54
Stafford	County Infirmary	77	28	36·36
Stoke-on-Trent	North Stafford Infirmary	99	50	50·51
Wolverhampton	South Stafford General Hospital	76	34	44·74
Worcester	Infirmary	99	36	36·36
Leicester	Infirmary	83	51	61·45
Lincoln	County Hospital	59	22	37·29
Derby	Infirmary	111	39	35·14
York	County Hospital	58	27	46·55
Swansea	Infirmary	80	8	10·00

Note.—The aggregate result in these groups furnishes a sufficiently correct indication of the prevailing mortality. The statement of the mortality of any One Hospital is qualified by the fact that the mortality is not deduced from the division of the deaths by the *average number* of patients, but by the number on one particular day.

Letter to the Registrar General on the Causes of Death in England in 1861, by William Farr, Esq., M.D., F.R.S., D.C.L. 213–231

Letter to the Registrar General on the Causes of Death in England, by William Farr, Esq., M.D., F.R.S.

Year 1861.

Sir,

I beg to submit to you the following observations on the prevailing diseases of the year 1861.

The mortality in that year, although it was below the average, was not so low as it was in the year preceding; and the increased prevalence of four diseases accounts for more than the whole of the difference.

Among the four prevailing diseases were typhus, including typhoid fever as well as relapsing fever, which medical practitioners distinguish, since these varieties were clearly defined by Dr. Jenner. The typhoid disease displays itself especially in the places which are also attacked by cholera, diarrhœa, and dysentery, the three other reigning diseases of the year.

The summer was warmer than usual; and the excess of mortality was in that season. The districts of the towns also suffered in more than the average proportion; because the enteric diseases are not the direct result of heat, but of the various zymotic matters, which, where they exist, are rendered unusually active in the air, in the water, and in the blood, under high temperatures.

It is shown by the returns, that there has been an unusual prevalence of diarrhœa, periodically passing into cholera or dysentery, ever since 1832; and in 1861 these diseases killed more than 20,000 persons. Fever, which is often propagated through the same channel, was fatal in 15,440 cases.

The practice of keeping the refuse of the sick and the healthy of successive generations in the cesspools alike of cottages and palaces every day grows more pernicious as the population becomes denser; for the water is defiled in wells, and even when the cesspools and drains are emptied into the Thames and rivers, it is pumped again into the houses only partially purified. The ova of worms and the seeds of various diseases are thus diffused among children; while great numbers of men and of women in the prime of life also suffer, and often die of the maladies which are the inevitable consequences of violations of natural laws.

The food of the people is taken from the land; and it appears to be a part of the economy of nature that to sustain fertility, the refuse should be restored, with the least possible delay to the land. The economic law is enforced by heavy penalties on the populations by which it is violated; but the penalty does not always fall on the offenders, and hence it is a case for the interference of the legislature. The existence of putrid dirt, or of any zymotic leaven, in towns and in the vicinity of dwellings, is a nuisance; and a legislative provision for its removal would be quite in conformity with the sound principles which are embodied in our common law.

I. Zymotic Diseases.

The remittent fevers of England have now subsided, and either attack few persons, or occur in a mild form; which, although it disables considerable numbers in the marshy districts, is rarely fatal. Thus 134 males and 120 females died of remittent fever; and 88 males, 61 females, died of ague and its complications.

The continued fevers destroyed the lives of 7660 males and of 7780 females in the year; or 15,440 persons in the aggregate. This, according to the estimate of Dr. Murchison, implies that about 154,400 persons were

attacked by fever in one or other of its three varieties; which are well established, but cannot yet be satisfactorily discriminated in the national returns, and are classed under the head of typhus.

The three forms of fever include pure *typhus*,—with blood spots on the skin (petechiæ),—which is exceedingly fatal, for 21 in 100 cases die in the London Fever Hospital. It is generated in crowded populations, and is often diffused by infection. Second attacks are seldom seen.

Typhinia. The second form of continued fever is described as *relapsing fever*, or famine fever; as the patient, after getting well apparently about the seventh day, is subject to sudden relapse on the fourteenth day; and the fever is epidemic and infectious in times of scarcity and famine. The mortality does not exceed $2\frac{1}{2}$ per cent.; and it has been designated by the short name of *typhinia*. To one death there are about 40 cases.

Typhoid fever or typhia. The third form of fever is endemic, and is characterized by an eruption of rose spots on the skin, with affections of the glands of the ileum and mesentery. The disease is often protracted to the 30th day; and at the London Fever Hospital 19 cases in 100 terminated fatally. It attacks the young. Second attacks are rare. So frequently is it generated or communicated by night-soil, that Dr. Murchison has named it pythogenic fever; and Dr. W. Budd insists that the alvine dejections of patients should be destroyed by disinfecting agents.*

The infantile remittent fever of England has been shown by Dr. West and others to be modified typhia, with which it is classified. Typhia is fatal to children; and it is, next to consumption, still the disease most fatal to men in the prime of life.

The mixing up of the three forms masks the peculiar endemic character of typhoid fever (typhia); but as it makes up a large proportion of the cases of death from continued fever, it is not difficult to point out, by means of the Table (pp. 160–171), some of the fever fields of England and Wales.

The mortality by fever was at the annual rate of 8 in 10,000; and for the sake of distinction, we may put down every district in which the mortality by the disease exceeded 8 in 10,000 as a fever field in the year. There an unusual number of men fell the victims of typhoid fever—typhia; while in other districts the deaths occurred in fewer numbers.

1770 persons died of fever in London; but this proportion (6 in 10,000) is below the average of the kingdom. Still the fever field of London covered Shoreditch, Whitechapel, Stepney, Mile End, Poplar, and Bermondsey. The Fever Hospital is in Islington, where the deaths from the disease in the Institution are registered. The patients are brought from all parts of London.

Guildford in Surrey was visited by the fever; 27 persons died. Dartford, Gravesend, and North Aylesford; Tenterden and West Ashford; Blean and Faversham; Thanet, including Margate and Ramsgate, as well as Dover, lost several lives by fever. Taking the whole of Kent, the mortality by fever in the county was somewhat below the average.

TABLE I.—**Deaths** from **Fever: Typhus, Typhia, Typhinia.**

* For full descriptions see the Treatise on the continued Fevers of Great Britain, by C. Murchison, M.D. This great systematic work gives the bibliography and synonymes, and all the prevailing doctrines of fevers, as well as the results of the author's own researches.

Battle, Hailsham, Ticehurst, Uckfield, and East Grinstead in Sussex, suffered from the endemic; in the Steyning District near Brighton, 31 persons died of fever, in Horsham 17.

The fever field extending over Portsea Island and Alverstoke was fatal; and the deaths amounted to 153, or to more than 1 in 1000. It is greatly to be regretted that the sanitary state of both Portsmouth and Gosport, the great seat of the naval and military power of the country, should still remain in the deplorable state that so many deaths imply. The Isle of Wight is in constant communication with Portsmouth; and was, unhappily, part of the fever field. Seventy persons died of fever in the Isle of Wight. Northwards the fever ascended the Southampton waters; and this seaport was another centre of the fever, which was, however, still more fatal in South Stoneham, and up the valley of the Itching in Winchester. Abingdon was another centre of the fever, which extended along the Thames valley, but was not so fatal in Windsor and Eton as in the Isle of Wight. Seven persons died of fever in the Windsor district.

I may perhaps be permitted to add here, that one of the seven was His Royal Highness the Prince Consort, who died on the fourteenth day of December, at the age of 42 years, after 21 days illness, of typhoid fever.

During his life he promoted measures for the improvement of the health of the people; and his death impresses on us with additional force the duty of investigating a disease which is fatal to thousands of all classes, and inflicts irreparable losses on the world.

Wycombe and other districts of the county of Buckingham; Bicester and several districts of Oxford; Royston and Walford; nearly all the districts of Northampton and Huntingdon; Bedford, Wisbeach, North Witchford, and Ely; all sustained heavy losses by fever. The whole of the South Midland Division, which sends its waters down to London, was infested by the fever to a much greater extent than London itself; and the waters from fever districts are not always free from the fever leaven.

In the Eastern Division the fever prevailed extensively, and of it 854 persons died, the mortality of the counties ranging from Suffolk to Essex and Norfolk, where it was highest. Rochford, Billericay, Tendring, Halsted, Braintree, and Dunmow were visited with some severity; so was Sudbury in Suffolk. In Norfolk,—Yarmouth, Erpingham, Foreboe, Depwade, and Walsingham and Freebridge Lynn, were centres of diffusion, and suffered severely.

A few districts, such as Mere and Sherborne in Wilts and Dorset, suffered; Honiton and St. Thomas, as well as Tavistock, in Devon, lost several lives by the fever; which was, however, especially fatal in Plymouth and the surrounding districts, precisely as at Portsmouth: so bad is the sanitary condition of all the seaport towns, which will in times of war undoubtedly affect unfavourably the efficiency of seamen. St. Germans, near the Plymouth waters, St. Austell, Truro, Falmouth, and Penzance, in Cornwall, complete the line of districts on the southern coast, which were in communication with each other by water, and were all visited severely by the fever. Bridgewater, Axbridge, and Clutton, Somerset, are among the fever districts.

The counties on the Severn suffered much less than the counties on the Thames and the southern coast; and Salop, in their centre, lost 4 in 10,000 inhabitants by the fever.

Staffordshire, and notably Walsall and Dudley, as well as the Worcester district, lost many lives by the fever: so did Leicester and Melton Mowbray; the districts of Lincoln; Basford and Nottingham; Derby, Belper, and Ashborne; Congleton and Northwich in Cheshire; Liverpool, Manchester, Wigan, Bolton, and the greater part of the districts of Lancashire, where the rate of mortality by fever on an average exceeded 9 in 10,000. Yorkshire experienced the same high mortality from the fever: the rate exceeding in some districts 10 in 10,000; as it did also in Durham.

The healthy districts of Northumberland, Cumberland, and Westmorland escaped with comparative impunity: Newcastle, Castle Ward, Tynemouth,

TABLE II.—**Deaths registered** from **Fever** in the **Isle of Wight** in the Year **1861.**

(The thirty Parishes in the Isle of Wight are divided into five Sub-districts in which these deaths were registered.

„ 16	Female	13 Years	Calbourne -	Typhus fever, 2 weeks. Certified.

SUMMARY.

SUB-DISTRICTS.	POPULATION, 1861.	DEATHS REGISTERED from FEVER in 1861.
Cowes - -	10,449	20
Newport -	13,761	23
Ryde - -	17,715	18
Godshill - -	8,020	6
Calborne -	5,417	3
TOTAL -	55,362	70

Hexham, Morpeth, and Cockermouth in these counties being the principal exceptions.

Wales and Monmouthshire have suffered extensively from fever; and the sanitary arrangements of the principality are not yet at all adapted to meet the wants of dense populations. At Abergavenny the people died by fever at the rate of 25 in 10,000; and the fever mortality was high in all the surrounding districts, except Chepstow. Great numbers died of fever at Merthyr Tydfil and Neath in Glamorganshire, and Swansea and Llanelly in Carmarthenshire, as well as in Pembroke and Haverfordwest. The districts on the southern coast of Wales suffered even much more than the districts of the southern coast of England. Aberystwith and some of the districts which are frequented in Wales by visitors also suffered from the prevailing fever.

The fever, in some of its forms, was fatal in every district of England and Wales, except three; but in some districts it was fatal to few, in others to hundreds, of people.

The fevers of the year were more fatal than they were in the previous year; but not so fatal as they were in the four years, including the year 1851 of the Exhibition, and the three years following, when the fever mortality exceeded 10 in 10,000; or when *one* in 1000 persons on an average died of fever. (*See* Table IV.) The range of mortality in the twelve years ending in 1861 was from 6·63 to 10·41 in 10,000.

The average rate of mortality from fever in the ten years 1851–60 was, among males, 9·07 in 10,000; among females 9·09 in 10,000, at all ages. One in 24 deaths from all causes was by fever. The total deaths by fevers in ten years were 172,458.

In the Table below the deaths are given at the different ages; and as there are *ten* attacks to *one* death, the *deaths* in *ten years* represent the attacks of fever in *one year*. But as the deaths are lowest in proportion to the attacks at the age of puberty, and as the rate of mortality increases with age, the *liability to an attack of fever* at each period of life is not represented by the deaths.

Diphtheria was recognized on its first appearance only by the most skilful medical practitioners; and it was often confounded with putrid sore throat or cynanche maligna, and scarlatina. Under these diseases 13,897 deaths were returned; including 9077 by scarlatina, 303 by cynanche maligna, and 4517 by diphtheria. The epidemic of diphtheria was at its height in 1859; and has since slowly subsided. But there is still a peculiar prevalence of sore throat, which is, perhaps, diphtheritic.

TABLE III.—ENGLAND. **Population** in **1851**, and **Deaths** from **Typhus** in the 10 Years **1851–60.**

AGES.	POPULATION, 1851.	DEATHS from TYPHUS in the 10 YEARS 1851–60.
All Ages	17,927,609	172,458
Under 5 Years	2,348,107	35,782
5–	2,092,359	22,338
10–	1,913,357	15,704
15–	1,757,189	17,392
20–	1,666,607	14,219
25–	2,746,601	18,491
35–	2,057,178	13,732
45–	1,507,790	11,546
55–	1,007,597	10,478
65–	577,681	8,713
75–	219,942	3,612
85 and upwards	33,201	451

Diphtheria prevails at later ages than scarlatina; for one third only of those who died of scarlatina were five years of age and upwards, while *one half* of those who died of diphtheria were of that age. Still diphtheria is a disease from which the children and youth of the country are the greatest sufferers; for while in seven years 1553 adults died of the disease at the age of 25 and upwards, 28,216 died under that age. Scarlatina is fatal in London and in Lancashire; but it ravages the coal districts of the north of England, and is undoubtedly diffused and rendered fatal by causes which should be investigated and removed. Quinsy was fatal in a small number of cases. Croup was as fatal as diphtheria: it attacks chiefly boys and girls of one, two, and three years of age. The boys die in greatest numbers. Girls, upon the other hand, suffer most from whooping-cough, which in the present year was most fatal to children. Of it 12,309 children died; and of measles 9055. These two diseases affect the texture of the lungs, and of the breathing apparatus. London lost 3548 children by whooping-cough.

Small-pox exists now almost by sufferance; but owing to the neglect, or to the inefficient practice of vaccination, 1320 deaths by small-pox were registered; 217 in London, 12 in Gravesend, 19 in Dover, 22 in Windsor, 30 in Northampton, 14 in Daventry, 27 in Wellingborough, 14 in Peterborough, 48 in Norwich, 18 in Exeter, 42 in Plymouth where it is dangerous to seamen and emigrants, 32 in St. Austell, 57 in Truro, 13 in Cheltenham, 18 in Caistor, 54 in Chesterfield, 15 in Manchester, 19 in Bradford, 14 in Rotherham, 25 in Durham, 38 in Newcastle-upon-Tyne, and 31 in Tynemouth, 17 in Carlisle, and 19 in Aberystwith.

TABLE IV.—ENGLAND. **Deaths** from **Fever—Typhus, Typhia,** and **Typhinia**—to 10,000 Persons living, and Proportional Number to 1000 Deaths.

YEARS.	Deaths to 10,000 Persons living.	Proportional Number to 1000 Deaths.

TABLE V.—**Deaths** in **England** from **Scarlatina, Cynanche Maligna,** and **Diphtheria,** for each of the **Years 1855** to **1861.**

YEARS.	TOTAL.	SCARLATINA.	CYNANCHE MALIGNA, and DIPHTHERIA.	CYNANCHE MALIGNA.	DIPHTHERIA.
1855 - -	17,314	16,929	385	199	186
1856 - -	14,160	13,557	603	374	229
1857 - -	14,229	12,646	1,583	1,273	310
1858 - -	30,317	23,711	6,606	1,770	4,836
1859 - -	29,494	19,310	10,184	597	9,587
1860 - -	14,893	9,305	5,583	376	5,212
1861 - -	13,897	9,077	4,820	303	4,517
Total - -	134,304	104,535	29,769	4,892	24,877

It is impossible to determine in these cases who is to blame in not procuring for the helpless children the protection which the legislature has provided against small-pox. The coroners, by holding a certain number of inquests, might ascertain how the matter really stands, and may prevent acts of negligence which in their consequences are as fatal as the ordinary offences of manslaughter.

A few deaths from cholera and dysentery occurred in nearly every county; and in London, Lancashire, and Yorkshire the number of cases was considerable.

Diarrhœa generally prevailed in the same districts as fever; and looking at the fatality of the disease at the advanced ages, it demands the careful study of pathologists, in connexion with typhoid fever (typhia) on one hand, and cholera and dysentery on the other.

Rheumatism destroys life by attacking the heart, the head, or other vital parts.

The deaths by all zymotic diseases amounted to 87,986; and they were 20 per cent., or one in five of the total deaths. The mortality by them was at the rate of 4·4 in 1000 living.

The miasmatic order, comprising the diseases to which I have been referring, caused nearly all the mortality (4·2). The enthetic order includes syphilis, to which the deaths of 785 males and 570 females are directly referred. 4 persons died of hydrophobia, and 6 of glanders. These diseases are propagated by the insertion of zymotic matter in the tissues of the skin.

Dietetic diseases are the result of the privation of food and drink, in their due proportions, either in infancy or later in life. Scurvy and purpura are now rarely fatal; only 207 males and 198 females died of these diseases. Alcoholism is slow poisoning by spirits, or by undue doses of fermented liquors; and to it the deaths of 524 males, 133 females are explicitly referred.

The parasitic diseases are less prevalent than they were formerly in England: 1055 deaths are ascribed to thrush; and 157 to worms. It is worthy of remark that girls suffer more than boys from worms; thus the deaths of 71 girls, and of only 41 boys under 5 years of age, were referred to worms, and in after life an equal disproportion prevails. The female tissues perhaps afford the most fruitful nidus for parasites.

TABLE VIII.—**Causes of Death registered in England in each of the Ten Years 1852—1861.**

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ The number of persons executed in the several years will not necessarily correspond with those in the same years of the "Criminal Returns," inasmuch as the executions recorded in each year in the latter are derived from the dates of conviction, while the numbers in this Table are classed under the years in which the deaths are registered.

§ The cases of angina membranacea which would now be put to diphtheria were formerly classed under the same head as scarlatina, but were distinguished in the notes.

II.—Constitutional Diseases.

84,987 persons died of the diseases in this class; namely, 16,233 of diathetic, and 68,754 of tubercular diseases.

Gout is a diathetic disease; only fatal when, like rheumatism, it fixes on one of the great seats of life. 247 deaths are referred to gout. Dropsy is the common consequence of heart disease, or Bright's disease of the kidneys (nephria); but it is, in the present state of medical knowledge,

* In this part of the Table, which comprises Deaths in 1852-57, the Violent Deaths are not distinguished according to Orders, &c., but are placed indiscriminately in the next line following.

† Up to the year 1857 cases of so called "debility" and "premature birth" were classed together; when the new classification was introduced "premature birth" was kept apart, and "debility" and "atrophy" were thrown into one line. This accounts for the changes in the table numbers.

due to the rapid improvements in diagnosis; for the members of the profession, through the medical journals, not only acquire knowledge of all new discoveries, but learn to apply them practically.

TABLE IX.—**Causes of Death in England in 1861.** Proportional Numbers dying from each Class of Causes, and from each Cause.

Class.	CAUSES OF DEATH.	1861 Deaths to 1,000,000 *Persons living.*	1861 Proportional Number in 1,000,000 Deaths.

* Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

Scrofula and tabes have apparently increased; hydrocephalus has diminished from the same causes. Phthisis (consumption) was fatal to 50,594 persons in 1852, and to 51,931 persons in 1861. It is now the most fatal disease in England, and deserves the most careful investigation.

The mortality by constitutional diseases was at the rate of 4·3 in 1000 living; of which 2·6 was by consumption: 20 in 100 deaths were by diseases of this class; and 12 of the 20 were by consumption.

III. Local Diseases.

The *local diseases* include the pure inflammations of the various systems; the direct results of inflammation; and functional disorders.

167,454 persons died of local diseases; or 39 in every 100 dying from all causes. The mortality by local diseases was at the rate of 8·4 in 1000 living.

Table X.—**Causes of Death in England** in the Year **1861**, arranged in the order of Mortality.

CAUSES OF DEATH.	Number of Deaths registered in the Year 1861.	*Proportional Number* from each Cause to 1,000,000 Deaths from All Causes.

Hydrophobia	4	9

The first order of the class comprises the diseases of the nervous system,—the brain and its membranes, the spinal marrow, the nerves of motion or sensation, the sympathetic system, and the organs of sense. The deaths by the diseases of this system amounted to 55,625 ; including 3426 by cephalitis (inflammation of the brain and its membranes), 8795 by apoplexy, 9812 by paralysis, both these diseases occurring most frequently at the advanced ages of life ; 2464 by epilepsy, which occurs at all ages, but is most fatal after puberty. Softening of the brain and some other affections of the system are undistinguished. Neuralgia is sometimes fatal ; 33 deaths were the results of ophthalmia, 47 of otitis, and 27 of tetanus not returned as traumatic. 20 of those dying by tetanus were males ; 7 females. The deaths of 25,423 children (chiefly) are returned as caused by convulsions. Three deaths are ascribed to fright, two to grief, one to rage, thirty-nine to melancholy.

The heart, and the organs of circulation which distribute the blood through every other system, were the seats of 18,076 fatal diseases. These diseases have increased since 1852 from 12,517 to the above number ; another evidence of the progress of diagnosis, rather than of the increase of heart disease. Angina pectoris killed 149 men and 74 women ; syncope 75 men and 96 women ; phlebitis 29 men and 34 women.

The respiratory organs were the seats of 64,310 fatal diseases ; and the annual mortality by them was at the rate of 3·2 in 1000. Consumption has its chief seat in the lungs ; and if this be also taken it makes the mortality 5·8 in 1000. More than 27 in 100 deaths are by diseases of the organs of breathing and by consumption. The most fatal diseases of the order are bronchitis and pneumonia. The number of deaths by pneumonia has not varied much in the last ten years ; while the deaths from bronchitis, on the other hand, have fluctuated extensively, and increased in the ten years from 17,073 to 30,986. This affection of the air tubes is frequently rendered fatal by extreme cold ; and influenza, fixing its chief seat in the same structures, is often confounded with pure inflammation of the mucous membrane of the bronchi. Bronchitis is particularly fatal to the old ; pneumonia to the young and to boys. Thus the deaths of 5,884 boys under five years of age are referred to bronchitis ; of 8802 to pneumonia. The girls are sufferers to a less extent from both these inflammations ; while the reverse happens in whooping-cough.

Deaths under five years of age by—

	Bronchitis.	Pneumonia.	Whooping-cough.	Total.
Girls - -	5183	7304	6495	= 18,982
Boys - -	5884	8802	5331	= 20,017

The deaths by diseases of the digestive organs are 20,327 ; and the mortality by them amounted to 1 in 1000 living. The diseases of the liver produce 7434 deaths, of the pancreas 18, of the spleen 86 ; and the other deaths are from diseases of the intestine and stomach. Exclusive of ascites, 809 deaths are referred to the stomach, 8466 to the intestines ; the latter presenting a larger area.

The diseases of the other organs and systems present many curious examples of fatal disease in both sexes, as will be seen on referring to the general and supplementary Tables. 9116 deaths are referred to the four orders, or 2 in every 100 deaths.

IV.—Developmental Diseases.

These diseases arise directly out of the incidents of formation, birth, growth, and decay ; and may be all designated as developmental phenomena. Premature birth is often the result of disease of the fœtus ; the malformations are only fatal when they interfere with important functions ; teething, paramenia, and childbirth give rise to certain peculiar fatal affections, of which they are the causes. Atrophy and debility are met

with in the infant chiefly under one year of age ; after the age of 75 they are treated as the natural symptoms of the decay of old age. 71,948 deaths are referred to this class.

V.—Violent Deaths.

The number of deaths by violence of various kinds is 14,985. This is the greatest number that has ever been registered in England ; and the increase in the nine years is 1465, for the deaths from the same class of diseases were 13,520 in the year 1852.

In the year 11 executions by hanging were registered ; 1347 persons put themselves to death by suicide ; 320 persons, according to the finding of the coroners, were murdered or slaughtered by men ; and 13,187 were killed by negligence or accidents of various kinds. 120 violent deaths were not described so as to admit of being classed.

Of the deaths by accident or by negligence 5589 are cases of fracture or contusions, 2351 are deaths by drowning, 258 by poisoning, 1014 by suffocation, 120 by gunshot wounds, and 41 by other wounds.

Burns and Scalds.—The deaths by burns are so numerous that it is desirable to examine them more in detail. In the year 3053 persons died of burns and scalds ; of whom 1620 were males, 1433 were females. The burns and scalds are sometimes immediately fatal ; at other times they produce extensive and superficial skin injuries, which are fatal after many weeks of sickness. A certain number of children are burnt by their clothes taking fire ; women are burnt in the same way. Fires burn people to death in conflagrations ; and in explosions of mines or of manufactories, the workpeople are liable to be burnt. In various ways the number of men, women, and children who die by fire in England is enormous. Burns have increased in recent years, and the time has assuredly come to endeavour to put a stop to these human sacrifices.

39,927 persons were burnt alive in England, or were scalded to death, in the fourteen years 1848–61. 1344 were infants under one year of age ; 4500 were children of one and under two years of age ; 4902 and 4875 were two and three years of age respectively ; and in these two years of age, before the child has learnt to dread the fire, it incurs the greatest danger. The boys, being in nursery language most "mischievous," are, until they are four years of age, burnt in greater numbers than girls ; but at that age and afterwards the clothes of boys are less combustible

Table XI.—**Deaths of Women in Childbirth** in the Fifteen Years **1847–61.**

Years.	Number of Deaths from: Metria and Childbirth.	Metria.	Accidents of Childbirth.	Deaths of Mothers to 10,000 Children born alive.
1847 - -	3226	784	2442	60
1848 - -	3445	1365	2080	61

than the clothes of girls, and fewer of them are burnt to death. 19,796 children under five years of age died of burns; 10,800 of their number were boys, 8996 were girls.

At the age of 5 and under 10, 2958 boys and 4982 girls were burnt or scalded* to death. At the age of 10 and under 15, children learn the danger of fire to some extent; but of the girls 1273, and of the boys 792, were burnt to death at that age. Subsequently men are exposed to fires and explosions, in mines and works; and from the age of 15 to 20 the young men died in greater numbers than the young girls; at the age of 20 to 25, the young men who were burnt to death amounted to 731, the young women to 328; at the age of 25 and under 45, the men are still more exposed, and 2079 were burnt or scalded to death, against 893 women of the same age; at 45 the men grow more cautious, or are less exposed, so their deaths by fire decline, and the difference is not considerable, but the male deaths preponderate; at 55 to 65 the deaths of females by burns are in excess; while at 65 and upwards the men are partially withdrawn from danger, but the old women's combustible dresses catch the flames in their state of feebleness, and 2122 of them were burnt to death in fourteen years.

The Druidical sacrifices, the fires of Moloch, the Inquisition, the fires of Smithfield, the burnings of witches in the middle ages, and the immolation of widows in India, naturally excite horror in the present age. They admit of no historical palliation. Still it is evident that the lives were offered up mistakenly with a view to the removal of evil, and that the sacrifices were sanctioned by the religion or superstition of the age and people. The deaths by burning in England are ascribed to Accidents; but they are none the less dreadful on that account, particularly when it is considered that the victims are often as unnecessarily exposed as moths to the flames in which they perish.

TABLE XII.—ENGLAND. Population **1851**; Average Annual **Deaths** and **Mortality** by **Burns** and **Scalds** in the 14 Years **1848–61**.

Note.—No correction has been made in this Table for increase of population, consequently the mortality is overstated. The Table shows the relative rates of mortality in the two sexes at thirteen different ages.

Of the 10,800 males dying of burns under 5 years of age, 683 were less than 1 year of age, 2534 were 1 year and under 2, 2793 were 2 years and under 3, 2620 were 3 years and under 4, 2170 were 4 years and under 5. Of the 8996 females dying under 5 years of age, 661 were less than 1 year of age, 1966 were 1 year and under 2, 2109 were 2 years and under 3, 2255 were 3 years and under 4, 2005 were 4 years and under 5.

* For the sake of brevity, "burn" is often used alone to describe all the injuries by fire and intense heat.

A special inquiry into the circumstances of the accidents by fire and by scalding water might suggest means by which they might be effectually

prevented; in the meantime the following points deserve immediate attention:—

1. *Open fires*, lights, and kettles of hot water, should be surrounded by GOOD GUARDS. This precaution is of capital importance.

2. Children and young people, and old women, should be systematically taught the danger of fire.

3. The dresses of young children and old women should be made as much as possible of worsted or wool; which will protect them against cold, as well as against fire.

4. The muslin dresses, and cotton and linen clothes, might very properly be starched with the chemical materials which are found by experience to render them to a certain extent incombustible.

5. Private houses should all be provided on each floor of the sleeping apartments with the means of escape in the event of the lower apartments taking fire during the night. Especial provision to be made for women and children.

6. Fireworks, powder-works, and chemical manufactories require special precautions.

7. Persons falling asleep near the fire, or near lights, (*a*) in a state of intoxication, or (*b*) in fits, are frequently burnt to death.

8. Young children drink scalding water out of the spout of the tea kettle, or fall into scalding water. This happens often in the lower classes, when the mother is out at work, and the young children are left at home alone. The means of obviating this danger are evident.

9. Special arrangements are, it is scarcely necessary to add, required for preventing the explosions of mines or of steam engines.

Public Institutions.

The great majority of the people of England live in detached dwellings; and a certain number reside in barracks, asylums, workhouses, hospitals, lunatic asylums, and prisons, or in public institutions, as they have been called, of various kinds.

The mortality of the inmates of some of these institutions is for various reasons much above the average; so the inmates having been returned at the Census, it was thought right to pick out the principal institutions in which the mortality was likely to be so great as to affect the mortality of the sub-district in which the institution is situated.

The list has been compiled on this principle, and does not include a great number of institutions of various kinds. It includes all the principal hospitals and workhouses.

The Commissioners in Lunacy, the Inspectors of Prisons, and the Poor Law Commissioners publish in their annual reports accounts of the respective institutions which come under their cognizance. The statistics of the hospitals of the country are not given at all, or are not given upon a uniform plan. Miss Nightingale, who perceived all the importance of

TABLE XIV.—ENGLAND: **Public Institutions.**

—		Number of Inmates on 8th April 1861.	Deaths in the Year 1861.			Annual Rate of Mortality per Cent.
			Persons.	Males.	Females.	
England	In 853 Public Institutions	154,602	32,437	19,137	13,300	20·98
	,, 690 Workhouses	119,984	22,785	12,822	9,963	18·99
	,, 106 Hospitals	12,709	7,227	4,950	2,277	56·87
	,, 57 Lunatic Asylums	21,909	2,425	1,365	1,060	11·07

this information, suggested that the hospital statistics should be collected in forms, of which the members of the Statistical Congress in London approved.* And if the hospital boards carry out the plan, they will place the hospital statistics on a level with those of the other institutions of the country.

The number of institutions in the Table XIV. is 853, which held 154,602 inmates on the day of the Census, exclusive of the officers and servants. 32,437 inmates died in the year; and assuming that the average is represented by the enumerated population, the mortality was at the rate of 20·98 per cent., or 210 per 1000; while the mortality of the population of all England was at the rate of 22 in 1000, or 2·163 per cent.

The mortality in these institutions was ten times as high as the mortality in the population generally.

The annual rate of mortality in the lunatic asylums was at the rate of 11 per cent., in the workhouses 19 per cent., and in the hospitals 57 per cent.

With respect to hospitals then, while the annual mortality of the general population was 2·16 per cent., the mortality of their inmates was at the rate of 56·87 per cent., or 26 times as high. The inmates of hospitals are, it is scarcely necessary to say, all suffering from diseases which tend generally to increase the risk of death.

The hospitals are filled by a succession of inmates, who remain for a time varying from a day to a month or a year, and the mortality is often given as so many deaths per cent. on the cases treated. The mean term of treatment varies in different hospitals; in many it averages 36·5 days, or the tenth part of a year. Assuming that term of treatment to be applicable, the mortality of the cases in these hospitals was 5·687 per cent. in 36·5 days; or the hospitals to every 100 beds occupied had nearly 57 deaths annually.

Hospitals enable the charity of the country to supply the sick with skilful medical advice upon the cheapest terms, and this has led to the establishment of the institution upon the voluntary principle in every county. An eminent physician or a surgeon can visit his patients in a short time as they lie in the same or in contiguous wards; and he often consents to attend them without any fee or salary. The collection of the sick under one roof conduces also to economy in the nursing department, in the kitchen as well as domestic service, and in the pharmacy, as the drugs can be purchased and dispensed at a cheap rate. A resident medical officer can attend to all the urgent cases.

TABLE XV.—Principal **General Hospitals** in **England** and **Wales, 1861.**

(*Special Hospitals are excluded from this Table.*)

See on page 205 a Classification of all the Hospitals.

* English Programme of International Congress, pp. 63–5. See also Report of the Proceedings.

The cost of the building is generally so great as to make the lodging much dearer than the best cottage accommodation.

One great evil has often counterbalanced all the advantages. The collection of a number of persons, exceeding those of an ordinary family, under one roof, has hitherto always had a tendency to increase the dangers of disease; for several diseases are, like fire and ferments, diffusible. The danger is increased when all the inmates are sick, for their breath and excretions spread through the wards. The dangers too are likely to increase in a faster ratio than the numbers, and the patients are less likely to recover health in the sickly atmosphere of a large building in a city than in pure country air.

These institutions were accordingly at one time infested by hospital gangrene, and by erysipelas; the lying-in hospitals were depopulated by fever (metria); infants perished by hundreds in the Foundling Hospitals; and even in the present day patients often die of hospital pyæmia, so frustrating the hopes of the skilful surgeon.

It must be stated that nothing can scarcely be worse than the ventilation and all the arrangements of the old hospitals.

The classes of cases which are admitted into particular hospitals, and the reasons for which patients are discharged, differ largely, so that the investigation of the effects of hospital air, and of treatment in the various establishments, requires great care and skill. It is so important, however, that it should be undertaken for the sake of the sick, and for the sake of medical science.

A careful comparison of the duration and of the rate of mortality of certain well-defined diseases in hospitals and in private practice would settle the question.

In the meantime it is evident from the Tables (p. 205 and p. 230) that the mortality of the sick who are treated in the large general hospitals of large towns is twice as great as the mortality of the sick who are treated in small hospitals in small towns.

It remains to be seen whether the mortality in small hospitals is not twice as great as the mortality of the same diseases in patients who are treated in clean cottages.

Should this turn out to be the case, the means of realizing the advantages of the *hospital system*, without its disadvantages, will then be sought and probably found, as the problem is not insoluble.

I have the honour to be,
Sir,
Your faithful servant,
W. FARR.

To
The Registrar-General.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.]

ANNUAL REPORT

OF THE

REGISTRAR-GENERAL

OF

BIRTHS, DEATHS, AND MARRIAGES

IN SCOTLAND.

Presented to both Houses of Parliament by Command of Her Majesty.

EDINBURGH:
PRINTED BY MURRAY AND GIBB,
FOR HER MAJESTY'S STATIONERY OFFICE.
1863.

[*Price One Halfpenny.*]

CONTENTS.

	Page
Abstract of Births Registered in Scotland, pursuant to the Act 17° and 18° Vict., c. 80, during each Month of the Year 1862, - - - - - -	5
Abstract of Deaths Registered in Scotland, during each Month of the Year 1862, -	6
Abstract of Marriages Registered in Scotland, during each Month of the Year 1862, -	7
Table shewing the Population, and the number of Births, Deaths, and Marriages in Scotland, and in its Town and Country Districts in 1862, and the proportion of each of these events to the Population. Also the number of the Illegitimate Births and their proportion to the Total Births, - - - - - -	8

REPORT.

TO THE

RIGHT HON$^{BLE.}$ SIR GEORGE GREY, BART., M.P.,

Her Majesty's Principal Secretary of State for the Home Department.

GENERAL REGISTRY OFFICE OF BIRTHS, ETC.,
EDINBURGH, 12*th February* 1863.

SIR,

In conformity with the Seventh Section of the Scottish Registration Act, 17° & 18° VICT. c. 80, I have the honour to submit to you a General Abstract of the Births, Deaths, and Marriages Registered in Scotland during the year 1862, in order that the same may be laid before Parliament.

As in my last Report, the number of Illegitimate Births is separately stated; and a Table is appended shewing the Number of Births, Deaths, and Marriages, in the Town and Rural Districts of Scotland respectively, and the proportion of these events to the estimated population.

I have the honour to be,

SIR,

Your faithful Servant,

W. P. DUNDAS,

Registrar-General.

1862. ABSTRACT OF BIRTHS Registered in Scotland, during each Month of the Year 1862.

FOURTH

DETAILED ANNUAL REPORT

OF THE

REGISTRAR-GENERAL

OF

BIRTHS, DEATHS, AND MARRIAGES

IN SCOTLAND.

Presented to both Houses of Parliament by Command of Her Majesty.

EDINBURGH:
PRINTED BY MURRAY AND GIBB,
FOR HER MAJESTY'S STATIONERY OFFICE.

1863.

REPORT.

TO THE

RIGHT HONBLE. SIR GEORGE GREY, BART., M.P.,

Her Majesty's Principal Secretary of State for the Home Department.

GENERAL REGISTRY OFFICE OF BIRTHS, ETC.,
EDINBURGH, *February* 26, 1863.

SIR,

I HAVE the honour to submit to you my Detailed Annual Report for the year 1858.

It was during that year that the Country suffered much distress in consequence of the extensive Bank and Commercial Failures; and that distress has left its tokens on the Death and Marriage Registers, in the shape of an increased number of Deaths, and a greatly diminished number of Marriages.

Since I submitted to you my Detailed Report for 1857, the Abstract of the Ages of the Population of Scotland has been so far completed in the Census Office, that I have been enabled to avail myself of its results in this Report. The Census of 1851 was not drawn up so as to enable me to ascertain the ages of the persons living in the Insular, the Mainland-Rural, and the Town Districts of Scotland; and I was consequently precluded in former Reports from showing the very marked influence which an Insular, a Rural, and a Town residence had on the Mortality at the different Ages. This defect has been supplied by the Census of 1861; and the facts ascertained seemed to me to be so very important, that I have deemed it proper to give a Review of the Mortality at the different Ages in these Three Great Divisions, and also in the Eight Principal Towns of Scotland, from 1855—the year in which the Scottish Registration Act came into operation.

The various Tables published in the former Detailed Reports are reproduced for 1858, in order that each year's results may be

strictly comparable with those already published; and that persons engaged in making inquiry into the various social and statistical facts relative to Births, Deaths, and Marriages, may find all needful facts ready to their hands. A few additional Tables, however, have been added to this Report, with the view of throwing further light on some of the social conditions of the Population.

As in former Reports, I have appended a Table showing the influence of Season on the Mortality; as also a Table showing the Monthly Meteorological Conditions of the Atmosphere, as deduced from observations made at 51 Stations of the Meteorological Society of Scotland.

It is gratifying to be able to state that the proportion of men and of women able to sign their names in the Marriage Registers continued high during 1858, seeing that 88·2 per cent. of the men, and 76 per cent. of the women, who married in Scotland during that year, were able to sign their names.

I may mention, that in order to keep the public informed as to the outbreak, or spread, of Epidemic and other Diseases, I publish monthly a Report on the Births, Deaths, and Marriages in the Eight Principal Towns of Scotland, giving the particulars of the fatal Diseases in each of these Towns, and at four periods of life. I also publish a Quarterly Return, in which I state the number of the Births, Deaths, and Marriages in every Registration District, with Notes by the Registrars relative to the outbreak of any particular Epidemic in any of these Districts. A short Annual Summary is also given, immediately on the close of each year, of the facts noted in these Monthly and Quarterly Reports. These periodical Reports are in addition to the official Annual Statement of the number of Births, Deaths, and Marriages registered in Scotland during the preceding year, and presented in conformity with the Seventh Section of the Scottish Registration Act, 17° and 18° VICT. cap. 80.

I have the honour to be,

SIR,

Your faithful Servant,

W. P. DUNDAS,

Registrar-General.

REPORT TO THE REGISTRAR-GENERAL.

SIR,

I HAVE endeavoured to carry out your instructions to avail myself, at the earliest possible moment, of the facts brought to light by the late Census of the Population, so as to exhibit more clearly than has yet been possible, the varying rates of Mortality which prevail among persons of different Ages residing in the Insular, the Mainland-Rural, and the Town Districts. The result has fully justified our expectations; for it shows that children in the Towns, under one year of age, are cut off in nearly double the proportion which they are in the Rural Districts; that, in fact, almost an exact fourth of those living under one year in the Towns are cut off yearly.

As this was the first opportunity we have had of ascertaining the ages of the inhabitants in the several Districts, a review is given of the proportion of Deaths at different ages from the year 1855, when the Registration Act came into operation. This has been done for all Scotland, for the Insular, the Mainland-Rural, and the Town Districts; and also for the Eight Principal Towns.

The year 1858 was that during which Scotland was suffering from the depression in trade, etc., in consequence of the great Bank failures in November and December 1857. Much distress consequently prevailed among the manufacturing and mining population: indeed, all classes suffered more or less; and the consequence was, that while the Marriages exhibited a great decrease, the mortality rose higher than it had been during the three previous years. The Births, however, not being under the influence of the same agencies, were in their full proportion.

TABLE I.—Estimated Population; with the Number of BIRTHS, DEATHS, and MARRIAGES registered in Scotland in each year from 1855 to 1858; and their proportion to the Population.

YEAR.	Estimated Population.	Births.	Deaths.	Marriages.	Excess of Births over Deaths.	Proportion to every 100 Persons living.		
						Births.	Deaths.	Marriages.
1855	2,958,162	93,349	62,004	19,680	31,345	3·156	2·096	0·665
1856	2,975,517	101,821	58,529	20,740	43,291	3·422	1·967	0·697
1857	2,999,872	103,415	61,906	21,369	41,509	3·456	2·068	0·714
1858	3,010,227	104,018	63,539	19,655	40,479	3·455	2·110	0·652

BIRTHS.

104,018 Births were registered in Scotland during the year 1858, giving the proportion of 345 Births in every ten thousand persons of the estimated population of that year. This was considerably above the English Birth-rate for the same year, which was only in the proportion of 336 Births in every ten thousand of the estimated population. If we compare the Birth-rates of Scotland and England for the years 1856, 1857, and 1858, the same result is arrived at, viz., that the Scottish Birth-rate is rather higher than the English, the mean annual Birth-rate of England for that period having been 342 Births in every ten thousand persons, while the Scottish was 344 Births in a like population. This is an extremely curious result, inasmuch as the proportion of Marriages in Scotland is so much lower than it is in England. The year 1855, being the first year in which the Registration Act came into operation, is not included in the above average for Scotland, inasmuch as there was necessarily a considerable deficiency in the number of the Birth registrations during the first three months of that year.

The proportion of Births to the population in the Three Great Groups into which Scotland is divided, varied greatly. Thus, in the Insular Districts, where the population has for years been decreasing in consequence mainly of the large emigration, only 275 Births occurred for every ten thousand persons. In the Mainland-Rural Districts the proportion was 329 Births in a like population; whereas in the Town Districts the Births were in the proportion of 380 for every ten thousand persons. By comparing the numbers in Table II., which shows the proportion of Births in these several Districts since 1855, it will be seen how very steady is the proportion in each from year to year; nay, in the Town Districts the proportion has been steadily 380 Births in every ten thousand persons for the whole three years. This fact shows that these proportions may be depended on as giving a general idea of the varying proportion of Births in these several Districts.

In last Report it was pointed out that the only circumstance which seemed to influence the Birth-rate was the Death-rate; and the varying proportion of Births and of Deaths in these several Districts was appealed to in proof of the correctness of that view. The same fact was noted in 1858. The Insular Districts, which yielded the fewest Births, also gave the fewest Deaths; and the Town Districts, where the Birth-rate was highest, had also by far the highest Death-rate. These facts may be seen in Table II.

TABLE II.—Proportion of Births, Deaths, and Marriages in every 100 Persons living in the Insular, Mainland, and Town Districts of Scotland during the years 1855, 1856, 1857, and 1858.

Years.	Insular Districts.			Mainland Districts.			Town Districts.		
	Births.	Deaths.	Marriages.	Births.	Deaths.	Marriages.	Births.	Deaths.	Marriages.
1855	2·292	1·644	0·441	3·067	1·784	0·580	3·421	2·682	0·839
1856	2·642	1·824	0·514	3·260	1·659	0·599	3·804	2·568	0·883
1857	2·737	1·414	0·585	3·305	1·744	0·629	3·805	2·685	0·869
1858	2·758	1·468	0·544	3·296	1·806	0·576	3·801	2·690	0·789

Of the 104,018 children born during the year, 53,694 were males, and 50,324 females, being in the proportion of 106·6 males for every 100 females, which is a rather higher proportion of males than is common to Europe. In the legitimate Births the proportion of the sexes was just about the average of all Europe, viz., 106·1 males to every 100 females; but the males so excessively preponderated among the illegitimate Births, that the proportion in them was 110·2 males for every 100 females.

The varying proportion of the sexes in the total Births, and also in the legitimate and illegitimate Births in each Division and County of Scotland, is shown in Table VII.; but the numbers during one year are too small to permit of any conclusions being safely drawn from the facts exhibited.

Of the 104,018 Births, 94,664 were legitimate, and 9,354 illegitimate; being in the proportion of one illegitimate in every 11·1 Births, or 8·99 per cent. of the Births illegitimate. As the proportion of such Births was only 8·5 per cent. of the Births in 1856 and 1857, while it rose to 8·9 per cent. in 1858, and since that year is still increasing, it appears that the causes which have led to that result are still in operation, and that, too, with undiminished effect, notwithstanding the prominent manner in which public attention has been called to this painful subject.

As in former years, it will be seen by a reference to Tables IV., V., and VI., that the proportion of illegitimate Births is lowest in the Insular Districts; next lowest in the Town Districts; and highest in the Mainland-Rural Districts. Thus, in the Insular Districts, only 5·39 per cent. of the Births were illegitimate; in the Town Districts, 8·44 per cent.; but no less than 9·67 per cent. in the Mainland-Rural Districts.

In former years it was pointed out that illegitimacy prevailed to a much greater extent in the Counties included in the North-Eastern and Southern Divisions of Scotland than in the other Counties. The last three columns of Table VII. show the facts regarding this for the year 1858, and present a complete accordance in this respect with the Returns of previous years. Thus, in the Northern Division of Scotland only 5·1 per cent. of the Births were illegitimate; in the purely highland North-Western Division the proportion was only 6·1 per cent. In the great manufacturing and mining South-Western Division only 7·5 per cent. were illegitimate; but in the

Town* . .	469,460	540,243	1,009,703	527,058	611,126	1,138,184	510,066	590,197	1,100,268
SCOTLAND .	1,375,479	1,513,263	2,888,742	1,449,848	1,612,446	3,062,294	1,427,538	1,582,689	3,010,227

* The constitution of some of the Town Districts in 1858 was slightly altered, so that the respective numbers of the Population in the Mainland and Town Districts do not strictly correspond with those of former years.

Southern Division 13 per cent. of the Births were illegitimate; while in the North-Eastern Division 14·6 per cent. were illegitimate.

It would be a very interesting and instructive subject to inquire what are the peculiarities in manners and morals among the inhabitants of those Counties where illegitimacy is so very high, as compared with the manners and morals of the natives of those Counties in which illegitimacy is low. That there must be some great difference, no one can doubt, when the results are seen so visibly as that the one County regularly furnishes nearly twice the proportion of illegitimate Births of the other.

Many are disposed, not unnaturally, to attach great weight to the insufficiency of house accommodation as one mode of accounting for the laxity of morals evinced by the preponderance of illegitimate Births. It is argued, that where there is insufficient accommodation for a family, and a necessary impossibility of observing the common decencies of social life, no other result in regard to the females especially could be looked for, than a loss of that modesty and innate delicacy which are the best safeguards in after-life. That over-crowding may have a pernicious effect, is what no one will probably be prepared to deny; but the facts which appear on the face of the Returns seem to show that other causes, as yet unknown, are at work in producing effects so greatly to be deplored.

TABLE IV.—Total Number of BIRTHS, DEATHS, and MARRIAGES registered in Scotland, and in its Three Great Divisions, in 1858, and their proportion to the estimated Population. Also the Number of Illegitimate Births, and their proportion to the Total Births.

If the proportion of illegitimate Births depended on the amount of house accommodation, it would be found that in every County or Division of Scotland the proportion of Families living in Houses of One Room would bear some proportion to the number of illegitimate Births in that County or Division. Now that we have procured a perfect Return of the house accommodation of all classes in Scotland, we have data on which we may estimate, with an approximation at least to a correct result, the effect which this overcrowding exercises in regard to the point now under consideration. That return is invaluable in many respects; but in none is it more remarkable than in showing that the supposed effect of deficient house accommodation is increasing the proportion of illegitimate Births, has no existence in reality. Thus, the North-Eastern Division of Scotland, which yields by far the highest per centage of illegitimate Births, is also that Division which has a very much smaller proportion of its population lodged in Houses of One Room than any other Division of Scotland! The facts on this head are shown in the accompanying Table, where the per centage of Families living in Houses of One Room is given in connection with the per centage of illegitimate Births in each of the Eight Divisions of Scotland.

DIVISIONS OF SCOTLAND.	Per Centage of Families living in Houses of One Room.	Per Centage of Illegitimate Births.
Northern	36·7	5·1
North-Western	30·1	6·1
North-Eastern	25·2	14·6
East-Midland	32·6	9·7
West-Midland	35·0	7·3
South-Western	40·6	7·5
South-Eastern	37·1	8·3
Southern	34·2	13·0

From this Table it is seen that the North-Eastern Division of Scotland, which includes the Counties of Nairn, Elgin, Banff, Aberdeen, and Kincardine, has only 25·2 per cent. of its Families dwelling in Houses of One Room; and yet it has by far the highest proportion of illegitimate

26,963 persons to add to the population as its natural increase for that year, or very nearly 10,000 persons more than were in reality added;—thus showing that about that number of persons had left Scotland either for the Army, Navy, or Merchant Shipping, or for emigration to England or Ireland, of all of which we have no means of ascertaining the numbers, but in this rough approximative manner.

MARRIAGES.

19,655 Marriages were registered in Scotland during the year 1858, being in the proportion of 652 Marriages in every 100,000 persons of the population. This was a proportion very greatly below the Marriage-rate of England for the same year, which was in the proportion of 805 Marriages in every 100,000 persons, the average yearly Marriage-rate of England being 820 Marriages in every 100,000 persons. This Scottish Marriage-rate for 1858 was also considerably lower than that of the three previous years in Scotland, the only years of which we have any certain statistics. Thus, in 1855, the rate was 665 Marriages in every 100,000 persons, in 1856 it was 697, and in 1857 it was 714 Marriages in a like population.

The year 1858, then, both in England and Scotland, was one in which the Marriage-rate was depressed far below its average. But this circumstance receives a satisfactory explanation in the fact that that was the year during which our whole commercial industry was deranged, and almost brought to a stand still, in consequence of the great Bank and other failures which occurred just at the close of 1857, and continued during the earlier months of 1858. This fact shows that the Marriage Register affords a tolerably good indication of the general prosperity of the country, as in times of scarcity or depression of trade Marriages are delayed till better prospects arise.

The Insular, the Mainland-Rural, and the Town populations equally suffered by this commercial depression, though its effects were most visibly seen in the Town, and least in the Insular districts. As the proportion of Marriages, however, among any people depends greatly on the demand for labour, it is found that the proportion of Marriages in the great Towns much exceeds that in the smaller Towns and Rural Districts, while that again exceeds that which occurs in the Insular Districts, where room is only made for a new family by the death of the old. Thus, in the Insular Districts, Marriages in 1858 only occurred in the proportion of 544 in every 100,000 persons. In the Mainland-Rural Districts they were in the proportion of 576 Marriages in every 100,000 persons, but in the Town Districts at the rate of 789 Marriages to a like population; all of these proportions being considerably below those of the previous year. (See Table II.)

During 1858, it appears that 9104 Marriages were contracted according to the rites of the Established Church; 4650 according to the forms of the Free Church; 2707 according to those of the United Presbyterian Church; 1697 according to those of the Roman Catholic Church; 379 according to those of the Episcopalian Church; 1034 according to the rites of various smaller religious denominations; while in 57 the form of the ceremony was not stated, and in 27 cases the Marriage was irregular.

These numbers show, in a rough way, the proportions of the population attached to each religious denomination,—a fact which might have been,

but was not, ascertained at the Census of 1861, from causes to which it is unnecessary to advert. As the proportions closely correspond with those of former years, this approximative mode of estimating the religious denominations of the people cannot be very far from the truth. These numbers are given in Table VIII.

Of the 19,655 men who married during the year, the ages of 19,607 were ascertained; and of that number, 1448 were under 21 years of age. Of the 19,655 women who married, the ages of 19,576 were ascertained; and of that number, 4172 were under 21 years of age. It thus appears that 7·38 per cent. of the men, and 21·23 per cent. of the women who contracted Marriage in Scotland in 1858 were under 21 years of age, or were minors in the eyes of the law.

In England the ages of the parties who marry are not so accurately ascertained as in Scotland; and previous to 1858, even the tabular statement of the ascertained ages did not distinguish them between 20 and 21 years of age, but classed them with those from 20 to 25 years of age. This distinction, however, was made for 1858, and enables us to compare the Marriages of minors in England with those of Scotland. Thus, of the

All Ages	19,655	19,655	884	884	10,083	10,083	8,688	8,688

156,070 men who married in England in 1858, the ages of only 92,697 are specified; and of that number, 7653, or 8·25 per cent., were under 21 years of age. Of the 156,070 women who married, the ages of 92,697 are specified; and of that number, 21,768, or 23·48 per cent., were under 21 years of age.

It thus appears that a considerably larger proportion, both of men and of women, under 21 years of age contract Marriage in England than in Scotland. The English proportion of the Marriages of minors, as given above, will be found to differ considerably from the proportions published by the Registrar-General of England in his Report. He seems to compare the numbers registered as minors with the whole number of men and of women who married during the year, instead of only comparing them with those in which the ages of the parties were ascertained. From that cause, apparently, the Registrar-General of England states that, in 1858, only 5·86 per cent. of the men who married, and 18·37 per cent. of the women who married, were minors, or under 21 years of age. It is quite apparent that there must be some error in this conclusion, seeing that the proportion of Marriages under 21 hold a constant relation to those under 25; and as the English proportion of the Marriages of persons under 25 years is very

TABLE X.—MARRIAGES, 1858. Number and Proportion of Men and of Women, under 21 years of age, who contracted Marriage in England and in Scotland, and in the Insular, Mainland, and Town Districts of Scotland, in 1858.

much higher than that of the Scottish Marriages at the same age, the proportion under 21 years must also be much higher. The proportional numbers, therefore, as given in Tables X. and XI., are probably correct.

Table X., in addition to showing the above facts, indicates the number and proportion of the Marriages of minors in the Insular, the Mainland-Rural, and the Town Districts of Scotland. By that Table it appears that only 3·17 per cent. of the men who married in the Insular Districts were under 21 years of age; while 7·33 per cent. were under that age in the Mainland-Rural Districts, and 7·86 per cent. in the Town Districts. The proportion of women who married under 21 years of age in these several districts maintained the same relative proportions, viz., 9·08 per cent. in the Insular Districts, 21·01 per cent. in the Mainland-Rural Districts, and 22·90 per cent. in the Town Districts.

In former Reports, attention was directed to the proportion of men and of women entering the married state under and above 25 years of age, as throwing considerable light on the social condition of the people, and as showing the comparative facilities for procuring a livelihood in the various Divisions of Scotland. Tables XI., XII., and XIII. exhibit these facts.

From these Tables it will be seen that 41·29 per cent. of the men who married in 1858 were under 25 years of age; but the proportion of women at the same ages amounted to 58·70 per cent. of the total number of women who married. In England, during the same year, 48·29 per cent. of the men who married were under 25 years, and 62·02 per cent. of the women; so that, speaking in a general way, Marriages are contracted at an earlier period of life in England than in Scotland. This appears to indicate that the means of obtaining a livelihood are greater in England than in Scotland, and serves somewhat to account for the great emigration of our population which must take place to England—an emigration not accounted for by the numbers who migrate to our Colonies or Foreign Countries.

The same striking disproportion which was noticed regarding the Marriages of minors, exists relative to the Marriages of persons under 25

Table XII.—MARRIAGES, 1858. Number and Proportion of Men and of Women under and above 25 years of Age, who contracted Marriage in Scotland, and in its Eight Divisions, in 1858.

8. Southern	1,233	1,233	514	718	719	515	41·67	58·25	58·33	41·75
SCOTLAND	19,607	19,576	8,096	11,492	11,511	8,084	41·29	58·70	58·71	41·30

years of age in the Insular, as compared with the Mainland or the Town Districts of Scotland. Thus, in the Insular Districts, only 24·69 per cent. of the men, and 48·36 per cent. of the women, who married during the year, were under 25 years of age; while in the Mainland Districts 41·72 per cent. of the men, and 58·99 per cent. of the women, who married, were under 25 years of age. In the Town Districts, again, the proportions were slightly higher, just as had been observed relative to the Marriages of minors. Thus, in the Town Districts, 42·50 per cent. of the men, and 59·43 per cent. of the women, who married, were under 25 years of age.

If the several Divisions of Scotland be looked at, a still greater discrepancy in the proportion of persons marrying under and above 25 years of age will be found; and in every case it will be found that the proportion of Marriages under 25 years of age indicates with surprising exactness the comparative facility of procuring a livelihood in these several Divisions. These facts are shown in Table XII. Thus, in the North-Western Division, where the population largely declined between 1851 and 1861, where there is no room for a new family till some old one dies out, only 19·41 per cent. of the men who married during the year were under 25 years of age. Contrast with this the South-Western Division, embracing our great industrial populations engaged in mines and manufactures, and whose numbers are increasing far beyond the average of Scotland. In that Division no fewer than 47·06 per cent. of the men who married were under 25 years of age, or greatly more than double the proportion of the North-Western Division.

Table XIII., in which the number of Marriages is compared with the population of the several Divisions of Scotland, exhibits these facts in a still more striking light; and though small numbers should never be rigidly compared, yet the general results bear out fully all the previous conclusions. Thus, in the North-Western Division, only 52 Marriages occurred in every ten thousand of the population; but in the South-Western Division 72 Mar-

TABLE XIII.—MARRIAGES, 1858. Number of Marriages, and their proportion to the estimated Population in Scotland and its Eight Divisions, in 1858; also the number of Males under and above 25 years of Age, who married in each of these Eight Divisions in 1858, and their proportion to the estimated Male Population of these Divisions.

In fact, these statistics of Marriage afford a means of ascertaining, with something like barometric precision, the comparative prosperity of each Division of Scotland, and the comparative facilities which each affords for procuring an honest livelihood.

Of the 19,655 Marriages, the condition of life was only ascertained in 18,845 cases. Of these 18,845 Marriages, it appears from Table XIV. that 16,196 were contracted between bachelors and spinsters; 1624 between widowers and spinsters; 533 between widowers and widows; and 492 between bachelors and widows. This indicates that in every 100 Marriages, 85·94 were between bachelors and spinsters; 8·62 between widowers and spinsters; 2·82 between widowers and widows; and 2·61 between bachelors and widows.

These proportions, however, differed in a somewhat remarkable manner in the Three Great Groups into which Scotland has been divided, as will be seen in Table XV., where it will be observed that a much larger proportion, both of widowers and of widows, re-marry in the Town than in the Mainland-Rural or the Insular Districts.

Not less striking are the peculiarities in this respect between the two largest Towns of Scotland, Edinburgh and Glasgow. Table XVI. exhibits

TABLE XV.—MARRIAGES, 1858. Proportion of Marriages between Persons in different conditions of life, in every 100 Marriages.

	Bachelors and Spinsters.	Bachelors and Widows.	Widowers and Spinsters.	Widowers and Widows.

during the year, 88·56 were bachelors, and 11·44 widowers; while of every 100 women who married during the year, 94·62 were spinsters, and only 5·38 widows.

It would appear, however, that in England a much larger proportion of widowers and of widows re-marry; for in 1858, of every 100 men who married, no fewer than 14·22 were widowers; while of every 100 women who married, 9·20 were widows.

These peculiarities in the national characters of the Scotch and English seem to be permanent, as nearly the same relative proportions recur year after year. The greater density in the population of England, which brings persons and families into more intimate social relations with one another, will not altogether account for this peculiarity; for neither in our crowded Town Districts, nor yet in Glasgow itself, does the proportion of the re-Marriages of widowers and of widows attain the mean of all England.—See Tables XIV. and XVI.

It affords a comparatively accurate estimate of the state of elementary education in a town or country, to ascertain what proportion of the population is able to sign their names. Since the Registration Acts came into operation, the Marriage Registers have been made available for that purpose both in England and in Scotland; and as every person who marries has either to sign his or her name, or affix his or her mark, in the Register, and the parties who do so may be supposed to be under the same influences year by year, it gives a tolerably fair estimate of the state of elementary education, to know what proportion of men and of women signed their own names, and what proportion affixed their mark.

During the year 1858, of the 19,655 men who married, 17,328 signed their names in full, and 2327 affixed their mark only. Of the 19,655 women who married, 14,929 signed their names in the Marriage Register, and 4726 affixed their mark. From these numbers it appears that of the men, 88·2 in every 100 were able to sign their names, while only 11·8 were unable to do so, and affixed their mark; while of every 100 women, 76 were able to sign their names, and 24 were unable to write, and signed by mark.

This is a much larger proportion, both of men and of women, able to write, than is indicated by the Marriage Registers of England for the same year. In England, during the year 1858, only 73 in every 100 of the men, and 62·4 in every 100 of the women, signed their names in full in the Marriage Register; while 27 in every 100 men, and 37·6 in every 100 women, affixed their mark.

Table XVIII.—MARRIAGES, 1858. Number and Proportion of Men and Women who signed their names by Mark, in Edinburgh and Glasgow, in 1858.

	Men.				Women.			
	Number of Men Married.	Number who signed by Mark.	Per centage who signed by Mark.	Per centage who signed their names in full.	Number of Women Married.	Number who signed by Mark.	Per centage who signed by Mark.	Per centage who signed their names in full.
EDINBURGH	1328	69	5·2	94·8	1328	112	8·4	91·6
GLASGOW	3158	423	13·3	86·7	3158	970	30·7	69·3

These facts, though so far satisfactory in showing that elementary education is more widely diffused among the people in Scotland than in England, prove also how much still requires to be done, seeing that nearly 12 per cent. of the men, and 24 per cent. of the women, in Scotland, could not sign their own names. It might have been expected that the populations of the Principal Towns would exhibit a much higher amount of elementary education than those living in the Rural Districts. But the reverse appears to be the case in Scotland, inasmuch as, while 90·5 men in every 100 who married signed their names in full in the Mainland-Rural Districts, only 86·9 in every 100 were able to sign their names in the Town Districts. The same occurred with reference to the women; for while 80·9 in every 100 women who married in the Mainland-Rural Districts signed her name in the Marriage Register, only 73·6 women were able to sign their names in the Town Districts.

It could scarcely have been believed that the two largest Towns of Scotland should exhibit such diversity in this respect, as Table XVIII. shows to exist between the inhabitants of Edinburgh and of Glasgow. Thus, while in Edinburgh only 5·2 per cent. of the men who married signed by mark, that number rose in Glasgow to 13·3 per cent. The disparity among the females was much greater. Thus, while in Edinburgh only 8·4 per cent. of the women who married during the year signed by mark, the proportion in Glasgow was 30·7 per cent.! It thus appears that 91·6 women in every 100 in Edinburgh were able to sign their names, but only 69·3 in every 100 in Glasgow. In that rapidly extending and prosperous Town, therefore, the means of education do not appear to have kept pace with its prosperity and increase; though the fact may perhaps be partly accounted for should the Census of 1861 ascertain that the proportion of Irish in Glasgow exceeds that of Edinburgh to that extent.

DEATHS.

63,539 Deaths were registered in Scotland during the year 1858, being in the proportion of 211 Deaths in every ten thousand persons of the population. During the same year the population of England died at the rate of 230 in every ten thousand persons; so that, high as was the Death-rate of Scotland, it was considerably below the English proportion. In so far as the Registration of Deaths from the beginning of 1855 indicates, it would appear that the mean annual mortality of the population of Scotland is constantly lower than that of England; for while the mean annual Death-rate of England, for the years 1855 to 1858 inclusive, was 220 Deaths in every ten thousand persons, that of Scotland for the same period was only 208 Deaths in a like population.

The different Death-rates among the inhabitants of the Insular, the Mainland-Rural, and Town Districts, were most striking. Thus, in the Insular Districts, 146 persons died during the year out of every ten thousand inhabitants; in the Mainland-Rural Districts, 180 persons died during the year out of a like population; while in the Town Districts the proportion rose to 269 Deaths in every ten thousand persons, or nearly double the Death-rate of the Insular Districts.

If we take the mean mortality of the four years, 1855 to 1858 inclusive, for these several Districts, we shall find that the proportions do not mate-

rially differ from those of 1858. Thus, the four years' average shows that in every ten thousand inhabitants of each of those Districts, 146 Deaths occurred annually in the Insular Districts, 174 Deaths in the Mainland-Rural Districts, and 265 Deaths in the Town Districts.

Agents, therefore, prejudicial to health and life must exist in Towns, from which the country is comparatively free, and it is the duty of the sanitary inquirer to find out what these agencies are; and this can be greatly aided by referring to correct Tables, which indicate the diseases which cut off the population, and the ages when these diseases proved fatal. Sanitary inquirers, however, have too much overlooked the influence of a Town residence in their search for the causes of this higher mortality; and attributed to faulty drainage, bad ventilation, and insufficient supply of water, what perhaps depended mainly on the over-crowding of human beings in one place. This fact will be more particularly alluded to, when speaking of the ages at which the population is cut off.

By Table IV. it is seen that males die in a much higher proportion than females. Thus, in all Scotland, in 1858, of every ten thousand of each sex, 221 males died during the year, but only 201 females.

The same disproportion was noticed in each of the Three Great Groups into which Scotland has been divided. Thus, in every ten thousand persons of each sex in each of these, 154 males, but only 139 females, died during the year in the Insular Districts; 186 males, but only 175 females, died in the Mainland Disticts; 270 males, and only 250 females, died in the Town Districts. Thus, however varying the general Death-rate was in each of these Districts, the proportionate Death-rates of the sexes were maintained nearly unchanged in all.

BOTH SEXES	3,010,227		63,539		2·1107	

The influence of sex on the fatality of diseases will be noticed afterwards.

As the Census of Scotland for 1861 has been drawn up so as to exhibit the ages of the population at every year of life under five years, it has been deemed requisite to give a review of the Deaths at different ages for the years 1855, 1856, and 1857 in addition to those of 1858, correcting the ages and the population by the Census of 1861. This has been done with the especial view of directing attention to the very large mortality which occurs among infants, and especially among those under one year of age. As this is the first time that Scotland has been able to procure the exact ages of the population for every year under five years, and for every Registration District, advantage has been taken of it to show the varying mortality at each age of life in the Insular, the Mainland-Rural, and Town Districts (all unattainable under the Census of 1851), and also in the Eight Principal Towns of Scotland. We have hence gone back with this review of the Deaths at different ages to the period when the Registration of Deaths first commenced in Scotland, viz., January 1st, 1855. We are thus presented with a four years' survey of the Death-rates of each sex at different ages, in each of these Districts and Towns; and are enabled to arrive at a more correct estimate of the prevailing rate of mortality at each age than if our view had been confined to one year.

It has just been pointed out, that the male sex was cut off at a much higher rate than the female. Tables XIX. to XXVI. show that this higher rate prevails at all ages, and in all parts of the country, from the period of Birth to that of old age. During some years, however, the female mortality assimilates to the male during the second and third year of life; indeed, it might almost be said that during these two years the mortality in

TABLE XX.—DEATHS, 1855, 1856, 1857. Proportion per cent. of Male and of Female Deaths to the Population at different Ages in all Scotland, for the years 1855, 1856, and 1857.

each sex was equal. At all other periods of life, however, males die in a higher proportion than females. Thus, take the very first year of existence, when the two sexes may be supposed to be in the exact same conditions as to food and clothing, and all hygienic conditions, and see what a marked difference there is in their proportional mortality. The mean of the four years, 1855 to 1858 inclusive, show that in every ten thousand of each sex under one year of age, 1499 males die in Scotland during the year, but only 1257 females.

Now this great disparity in the mortality of the sexes at that early period of life can be referred to nothing but an impressed law of Nature due to sex, and to no other cause. In after life we might imagine it could be accounted for by the greater exposure of the male, to his more unhealthy occupation, to the greater anxieties and cares to which he is subjected, to his more frequently injuring his health by the abuse of tobacco or of spirituous liquors; but all this will not account for the greater mortality of the male while a nursing infant, nor will it serve in the smallest degree to account for the fact that even during his intra-uterine life, he is more liable to death than the female—the male still-Births greatly exceeding the female, viz., in the ratio of 13 to 10. When, therefore, it is observed that it seems to be the natural law that males die in a higher rate than females, we must be especially careful not to ascribe to unhealthy occupations or other causes that which is due to sex alone.

It is always useful to compare the mortality of one Country with that of another which is as nearly as possible under the same external conditions, and consists of the same race of mankind. Let us see, then, what is the

mortality of the male and female infants under one year of age in England. Unfortunately, the comparison cannot be made for the same years, seeing that, so far as we have observed, no facts have been published by the Registrar-General of England which show the annual Death-rate among infants under one year of age, since his Ninth Report. We are forced, then, to compare the mortality of these infants in England for the seven years 1838 to 1844 inclusive, with those of Scotland for the four years 1855 to 1858 inclusive. The comparison will not show England at a greater disadvantage than if we had the like particulars for 1855 to 1858, as the mean annual mortality of the seven years 1838 to 1844 was lower in England than during the latter period, and of course the infant mortality would be lower also.

From the highly valuable Tables given in the Supplement to the Ninth Annual Report of the Registrar-General of England, it appears that, during the seven years, 1838 to 1844 inclusive, male infants under one year of age were cut off in the annual proportion of 20·510 out of every 100 living at the same age, while only 15·440 females under one year died annually out of every 100 at that age. In Scotland, during the four years 1855 to 1858 inclusive, male infants under one year of age died in the annual proportion of 14·995 out of every 100 living; while female infants under one year of age died in the proportion of 12·577 out of every 100 at that age. These facts indicate that in England nearly a fourth more male infants under one year die annually in proportion to the living at the same age, than die in Scotland; and about a fifth more female infants.

Passing, however, from such comparative estimates, the excessively

high rate at which our own infant population in the Towns is cut off, must not be overlooked. Tables XXI. to XXVI. show, what could not be done in former years, that the mortality of infants under one year of age, in the Town Districts, is very nearly twice that of the mortality in the Insular or in the Mainland-Rural Districts. Thus, of 100 male children under one year of age living in each of these Districts during the four years 1855 to 1858 inclusive, it appears that 10·600 die annually in the Insular Districts; 11·534 in the Mainland-Rural Districts; but no fewer than 20·716 in the Town Districts. The like proportional mortality was noticed with regard to the female infants. Thus, of every 100 female infants under one year of age living in each of these Districts during these four years, 8·296 died annually in the Insular Districts; 9·330 in the Mainland-Rural Districts; but no fewer than 17·572 annually in the Town Districts.

Towns, then, are not only unhealthy to those at adult ages, but to persons at all ages alike, and in a somewhat higher proportion to infants under one year and under five years of age, than to the population above these ages. This fact is made very apparent, if we compare the male mortality under and above five years in the Mainland Districts with that in the Town Districts for 1858. The per centage of male Deaths to the population under five years of age was 4·457 in the Mainland Districts, 9·707 in the Town Districts: in other words, the effect of a Town residence on children under five years of age was, that more than twice as many died annually in the Towns than in the Country Districts in proportion to the number living at that age. The per centage of male Deaths to the population above five years and to the end of life, was 1·417 in the Mainland Dis-

tricts, but 2·169 per cent. in the Town Districts; or, in other words, the effect of the Town residence in persons above five years and to the end of life, was only to increase the mortality one-third, whereas under five years of age the Town residence had more than doubled the mortality observed in the Rural Districts.

The above is a most striking fact, because it shows, in the clearest light, the direct effects of a Town residence on the mortality. The above facts clearly establish that it is not the more unhealthy occupations nor the vices of a Town, nor the abuse of intoxicating liquors or of tobacco, which cause the higher mortality in the Town; but that it is something which affects every resident at every age—ay, even the nursing infant more powerfully than the adult.

Tables XXVII. to XXXIV., besides giving, as in former Reports, the Deaths at different ages, and their proportion to the estimated population at each age, for the Eight Principal Towns of Scotland, give a review of the proportion of Deaths at each period of life for the four years 1855 to 1858 inclusive; and specify the particulars for each year of life under five years. These Tables will prove valuable to any one who wishes to study the sanitary condition of any of these Towns, and the period of life at which the mortality proves heaviest.

Causes of Death.

Of the 63,539 Deaths registered in Scotland during the year 1858, the Cause of Death was assigned in 59,930 instances, leaving only a fraction more than $5\frac{1}{2}$ per cent. of the cases in which no Cause of Death was men-

tioned. Of the 3609 cases in which no Cause of Death was assigned, 1934 were under one year of age; and although including a considerable number of infants found dead, chiefly consisted of nursing infants who had not had the benefit of medical attendance, and who were reported by their parents or guardians to have died from "Bowel-hives" (or "Bull-hives,") the vernacular name under which is included Enteritis, Convulsions, Diarrhœa, Dysentery, and Teething. It being impossible to ascertain the precise Disease in these cases, all which had that Cause of Death assigned have been tabulated under the head of "Causes not Specified."

If these cases under one year of age were excluded, it would only leave 2·79 per cent. of the Deaths in which no Cause of Death was specified.

Class I. *Zymotic Diseases.*

The Zymotic (or Epidemic) and Contagious Class of Diseases cut off 14,132 persons in Scotland during the year 1858, and thus constituted 23·58 per cent. of the Specified Causes of Death. Allowing for the proportion in which the Causes of Death were not specified, this would indicate that in every hundred thousand persons in the population, 497 had died from the Zymotic Class of Diseases during the year; in fact, the proportion was exactly the mean annual mortality from that Class of Diseases for the three previous years.

It may be mentioned, once for all, that in every case in which the proportion to the population is stated in which any Disease proved fatal, it always includes the proportion of cases in which the Cause of Death was

not specified. Thus, as the non-specified causes amounted to 3609, the proportion which must be added to the 14,132 Zymotic Class of Diseases is 851, to enable us to ascertain the true proportion in which the Zymotic Class of Diseases proved fatal in the population; and the same has to be done with all the various Diseases and Classes of Disease.

The mortality from the Zymotic Class of Diseases, however, fluctuates to a much greater extent from year to year than that of any other Class of Diseases. It may happen, however, that from various circumstances not at present understood, the mortality from that Class of Diseases remains low for several successive years; when, all at once, without any apparent change of weather, or other circumstances, so far as we at present are able to trace, Epidemics became prevalent, spread over the country, and immensely increased the mortality. Such happened in England during the year 1854, and again in 1858. In England, during the year 1854, the Deaths from the Zymotic Class of Diseases amounted to 618 in every hundred thousand persons of the population; and in 1858 to 579 Deaths in a like population—making the English Tables of Deaths to correspond with the Scottish as to the Diseases classed under the name Zymotic. No such great fluctuations were observed in Scotland during the four years 1855 to 1858 inclusive, seeing that the highest proportion of Deaths from the Zymotic Class, viz., 505 Deaths in every hundred thousand persons, occurred in 1855; and the lowest proportion, viz., 495 Deaths in a like population, occurred in 1856.

From the above fact it might be deduced that Epidemics must be under different agencies in England and in Scotland, or at least that these agencies, whatever they are, do not act with equal force in the two countries

TABLE XXVI.—DEATHS, 1855, 1856, 1857. Proportion per cent. of Deaths to the Population at Different Ages in the Town Districts of Scotland for the Years 1855, 1856, and 1857.

during the same year. This view seems to receive plausible support from the fact that during 1858, the year whose vital statistics we are considering, the mortality from the Zymotic Class of Diseases amounted in England to 579 Deaths in every hundred thousand persons, but in Scotland to only 497 Deaths in a like population.

When the facts are looked at more minutely, however, they seem susceptible of another explanation, which may be the correct one. In both England and Scotland during that year, Scarlatina was the leading Epidemic, but the mortality was very much higher from it in England than in Scotland; England losing in the proportion of 157 in every hundred thousand persons, but Scotland only 94 in a like population. The extremely different mortality which attends Epidemics in Town and Country Districts, proves that it is density of population which is one of the most powerful agents, both in spreading Epidemic Disease, and in rendering its fatality greater when it does break out. As England, therefore, is so very much more densely peopled than Scotland, and contains a greater proportion of large populous Towns, this greater density of population may be the reason why, in Epidemic years, the Deaths from the Zymotic Class of Diseases prove so much more numerous than in Scotland. In last year's Report it was pointed out that in years of mean mortality, the Deaths from the Zymotic Class of Diseases were more numerous in Scotland than in England, and it was inferred that this might be owing to the more cleanly habits of the English, their more healthy dwellings, etc. But in Epidemic years, density of population appears to be that which exercises the most powerful influence both on the diffusion and the mortality of these Epidemics. In densely

peopled places, seclusion of the sick is impracticable: hence all Epidemics spread more rapidly in the Town than in the Country; and schools are frequently the means of spreading Disease over a Town or District, from children being allowed to go to school with the Disease upon them, or being sent back to school too soon after they have had it; or from some of the children of an infected family being still sent to school, though others were confined to bed with the Disease.

These remarks as to the varying mortality from the Zymotic Class of Diseases in populations of different densities receive strong support from what was observed in Scotland during 1858, in the Three Great Groups into which it has been divided. In every hundred thousand living in each Group, 193 died during the year from the Zymotic Class of Diseases in the Insular Districts, 359 in the Mainland-Rural Districts, which include the small Towns and Villages; while in the Town Districts the proportion of Deaths in a like population rose to 712. It will be observed that these rates differ greatly from the general proportion at which the population die from all causes in each of these Districts. Thus, if the Death-rate from the Zymotic Class of Diseases had been at the same rate in the Towns, as compared with the Insular Districts, as their respective general mortality, then, while 193 in every hundred thousand persons died from the Zymotic Class of Diseases in the Insular Districts, the Town proportion ought to have been 355 Deaths. Instead of that, however, the Town proportion was 712 Deaths, or exactly double the rate it ought to have been, had the Zymotic mortality in Town and Insular Districts retained the same relative proportions as the general mortality.

Of the 14,132 persons cut off by the Zymotic Class of Diseases, 6860

were males, and 7272 females, which in every hundred thousand of each sex gives the proportion of 511 male, and 486 female, Deaths from the Zymotic Class of Diseases. This is a proportion of males lower than in the general mortality from all Diseases. Thus, if males had been cut off by Zymotic Diseases in the same proportion as by all causes, for the 486 female Deaths there would have been 534 male Deaths; whereas there were only 511 male Deaths. From this it may be inferred that the Zymotic fall less heavily on the male than the other Classes of Disease, seeing the proportion is lower than in the general mortality from all causes.

Of the Eight Principal Towns of Scotland, the Epidemic mortality was highest in Glasgow, and lowest in Aberdeen, during the year 1858; being in the proportion of 854 Deaths in Glasgow, but only 420 Deaths in Aberdeen in every hundred thousand of the respective populations. The relative mortality from this Class, and a few of the most fatal Diseases, in each of these Towns, is shown in Table XXXVII. Another Table is appended relative to these Towns, showing the per centage of Deaths to the corrected populations of these Towns for the four years 1855 to 1858 inclusive, and the mean annual mortality during these four years. From this it will be seen that the mean annual mortality was highest in Greenock, and lowest in Leith. This is a rather remarkable circumstance regarding Greenock, because the immense influx of young able-bodied workmen, so much greater in proportion than in the other Towns, ought to have had the effect of showing a diminished general mortality, and proves that its general unhealthiness has not been overestimated. As to Leith, again, it is scarcely fair to instance it as the healthiest Town, seeing that the sick hospital in

Edinburgh (the Royal Infirmary) drafts from Leith a considerable proportion of cases, whose Deaths occurring in that Institution are reckoned as Deaths in Edinburgh. This circumstance swells the proportion of Deaths in Edinburgh beyond what is due to its own population, while it in a far greater proportion, from the smallness of the Town, diminishes the proportion of Deaths in Leith. For these reasons, in so far as these four years' results show, Aberdeen must be regarded as the healthiest of the Eight Principal Towns of Scotland; Edinburgh and Leith following next in order.

Of the individual Zymotic Diseases, Small-pox only cut off 332 persons during the year 1858, being in the very low proportion of 11 Deaths in every hundred thousand persons living. In England, during the same year, Small-pox was very much more fatal, viz., in the proportion of 33 Deaths in every hundred thousand persons; from which it may be inferred that the prevalence and fatality of any particular Epidemic in England by no means implies that it is equally prevalent or fatal in Scotland during the same year.

1538 Deaths resulted from Measles during the year, or in the proportion of 54 Deaths in every hundred thousand persons living. In the same number of persons living respectively in the Insular, in the Mainland, and in the Town Districts, 2 only died in the Insular, 29 in the Mainland-Rural, but 99 in the Town Districts; thus proving, in the most striking manner, how a Town residence wastes human life, fostering and spreading Disease, and rendering it more fatal when it makes its attack.

Of the children's Diseases, Scarlatina was the chief Epidemic of the year, and proved fatal to 2671 persons, being in the proportion of 94 Deaths

in every hundred thousand persons living. During the same year, Scarlatina was by far the most fatal Epidemic in England, but there it raged with a fatality not even equalled in our Town Districts, 157 persons having died from it in every hundred thousand persons of the population. In Scotland, of every hundred thousand persons living, respectively, in the Insular, Mainland, and Town Districts, 16 died from Scarlatina in the Insular Districts, 67 in the Mainland-Rural, but 145 in the Town Districts; so that though these facts again prove what a fearfully greater mortality from Epidemic Diseases prevails in the Town Districts, they show that during that year the Death-rate of mortality from Scarlatina over all England exceeded that of the Town-rate in Scotland.

Diphtheria first showed itself in the Epidemic form in Scotland in 1857, but only in a few isolated spots, having apparently no connection with each other, and chiefly in sequestered rural situations, in some of which the sanitary condition was very bad. Thus, of the 76 Deaths reported from that Disease in 1857, there occurred 51 in the Mainland-Rural Districts, but only 23 in the Town Districts. During 1858, Diphtheria spread considerably over the Country, in some Districts seeming to take the place of Scarlatina, or causing that Disease to assume more the form of Scarlatina Anginosa, so that the one complaint was often mistaken for, if it did not actually run into, the other. During 1858, the registered Deaths from Diphtheria amounted to 294.

From the Quarterly Reports of the Registrar-General of England, it appears that Diphtheria appeared in England also for the first time as an Epidemic, in recent years, in 1857, but greatly increased during 1858. It

is a remarkable fact in its history, then, that it manifested itself in both Countries, and increased, along with an Epidemic of Scarlatina. Its connection with the Epizootic Aphtha of cattle has not yet been satisfactorily traced; but that there is a connection can scarcely be doubted, when it is known that the most successful treatment of Diphtheria in the human subject, and of the Epizootic Aphtha in animals, is the very same, viz., washing the aphthæ and ulcerations with a diluted solution of chloride of lime, and supporting the strength.

Hooping-Cough was the next most fatal Epidemic Disease of children, and cut off, during the year, 1963 persons; and it is the remarkable peculiarity of that Disease, that it proves fatal to a much larger proportion of females than males. Thus, during 1858, while out of every hundred thousand males in the population, only 62 died from Hooping-Cough, in a like number of females, 75 died from the same Disease.

Croup is a Disease which is much more fatal in Scotland than in England. Taking the average of the four years 1855 to 1858, it appears that, in every hundred thousand persons, 27 only died annually from Croup in England, but 37 in Scotland. During 1858 that Disease caused 1200 Deaths in Scotland, or in the high proportion of 41 Deaths in every hundred thousand persons of the population.

All these Epidemic Diseases, to which children are liable, prove fatal very nearly in proportion to the youth of the child, so that it ought to be an object with every parent to secure his younger children from Epidemic Diseases so long as he possibly can. Every year the child is older, there is less risk of its falling a victim to those Diseases, and a greater chance that,

if attacked by them, it will recover. Thus, if we take these Epidemic Diseases, Small-Pox, Measles, Scarlatina, Diphtheria, Hooping-Cough, and Croup, we find that in Scotland, during 1858, there died in all 7998 persons under these Diseases; but of that number, no fewer than 6443 were under 5 years of age, and only 1553 at all ages above 5 years. Of these 6443 who were under 5 years of age, 1576 were nursing children under 1 year; 2038 were 1 and under 2 years of age; 1250 were 2 and under 3 years old; 944 were 3 and under 4 years of age; and 635 were between 4 and 5 years of age.

1524 Deaths from Diarrhœa, 599 from Dysentery, and 83 from Cholera, occurred during the year, being in the proportion of 53, 21, and 2 Deaths respectively from these Diseases in every hundred thousand persons. These are proportions greatly below those of the previous year. These Diseases, it may be remembered, unlike most of the others which prevail in this Country, increase with the rise of temperature, and diminish as the temperature falls. As no unusually warm weather occurred during the year, excepting for about a fortnight in June (and that was immediately followed by much cooler weather), the mortality from these Bowel Complaints remained low, and the population did not suffer from them to the extent they usually do when the temperature continues steadily higher. England, on the other hand, being further south, and having a higher summer temperature, as a general rule suffers more from these Bowel Complaints. Hence, while a four years' average, 1855 to 1858 inclusive, shows that 81 persons die annually in England from Diarrhœa out of every hundred thousand living, only 53 died annually in Scotland out of a like population during the same period.

Typhus Fever was the most fatal of the Epidemic Diseases in Scot-

land during 1858, proving fatal to 2790 persons, of whom 1349 were males, and 1441 females. Under this term are included Gastric, Typhoid, and Relapsing Fevers, as well as Typhus proper, and no good reason exists for not also including Infantile Remittent Fever. These Fevers seem to be rather more prevalent and fatal in Scotland than in England. A four years' average—1855 to 1858—shows that the same Class of Fevers cut off annually in England 93 persons out of every hundred thousand living; while the proportion in Scotland during the same period was 99 Deaths annually in a like population.

Of the Eight larger Towns of Scotland, the greatest mortality from Typhus occurred in the healthiest of these Towns—Aberdeen—the proportion being 158 Deaths from Typhus to every hundred thousand living. Attention was directed to this fact in former Reports, as being a curious anomaly. It must depend on some local cause, which favours the production of Typhus and Gastric Fevers, and is well worthy the attention of the local authorities and medical men; for such a very high mortality from Typhus should not co-exist with such a very low general mortality.

Of the other Zymotic Diseases, Influenza caused 365 Deaths; Erysipelas, 270; Metria, 152; Syphilis, 86; Noma, 12; Purpura, 44; and Hydrophobia, 1. Of the 86 Deaths from Syphilis, 66 were congenital, and occurred before the third year of life.

Class II. *Diseases of Uncertain Seat.*

The Diseases of Uncertain Seat cut off 2360 persons, of whom 939 were males, and 1421 females; thus giving the proportion of 83 Deaths in

During the year, 1045 Deaths were attributed to Dropsy, of which 445 occurred in males, and 600 in females, giving the proportion of 36 Deaths from Dropsy in every hundred thousand persons; or 33 males and 40 females in a like number of each sex.

Cancer caused 963 Deaths, 306 being males, and 657 females, being in the proportion of 22 males, but 43 females, in every hundred thousand persons of each sex. These are the average annual proportions for Scotland, so that it may be considered as a proved fact, that in this Country Cancer proves fatal to women in exactly double the proportion it does to men. Cancer is not one of the Diseases whose prevalence or mortality seems to be increased by a Town residence, so that its prevalence and fatality seems to be pretty uniform over the Country.

Class III. *Tubercular Diseases.*

The Tubercular Diseases form the second most fatal Class of Diseases in Scotland, and include that complaint which, by itself, cuts off a greater proportion of the population than any other Disease, viz., Consumption. During 1858, the Tubercular Class of Diseases proved fatal to 10,265 persons, of whom 5127 were males, and 5138 females. This indicates a proportion of 361 Deaths from that Class of Diseases in every hundred thousand of both sexes, or 381 males, and 343 females, in every hundred thousand persons of each sex. Males, therefore, appear to suffer more from that Class of Disease than females; but not more than they do from every other Class of Disease, seeing that if males and females died from that Class of Disease in the same relative proportion as they die from all Diseases, 381 males would infer a female mortality of 346, the actual female proportion for the year being 343.

Excepting the Zymotic Diseases, and the Inflammatory Affections of

This Table may be read without the decimals, thus: In every hundred thousand persons living in each Town, there died during the year from Phthisis, 386 in Glasgow, 304 in Edinburgh, 357 in Dundee, 337 in Aberdeen, 405 in Paisley, 400 in Greenock, 235 in Leith, and 378 in Perth.

the Respiratory Organs, there is no Class of Diseases whose prevalence and fatality are so greatly aggravated by a residence in Towns as these Tubercular Diseases. Thus, of every hundred thousand persons living in the Insular, in the Mainland-Rural, and in the Town Districts, 211 only died from the Tubercular Class of Diseases in the Insular Districts, 266 in the Mainland-Rural Districts, but 499 in the Town Districts. This fact shows in the strongest possible light the blighting influence of a Town residence on the life of man. This whole Class of Diseases may be considered as purely Diseases of Debility, brought on by causes which tend to lower the vital energy, prevent the proper arterialization of the blood, and impair the digestive and assimilating processes. These Diseases are still far too common in even the Country parts, because the close unaired house, the box-bed, and the damp unhealthy site of the cottage, do for the inhabitants of the Rural parts that which like causes with over-crowding do for his still more unfortunate brother in the Towns. But there can be no doubt that in both cases the mortality might be diminished by at least a half were proper means taken to ensure proper ventilation, to procure dry, well-drained sites for the houses, and prevent over-crowding in the rooms, or within the same building.

Phthisis, or Consumption, the most fatal malady in this Class, is also the Disease which proves more fatal to the inhabitants of Scotland than any other individual Disease. During 1858, the Deaths from Consumption numbered 7264, of which 3531 were males, and 3733 females. This gives the proportion of 255 Deaths during the year in every hundred thousand persons of both sexes, or 263 males, and 249 females, in every hundred thousand persons of each sex.

Consumption was almost exactly twice as fatal in the Town as in the Insular Districts. Thus, in every hundred thousand persons in each of the Three Great Groups into which the inhabitants of Scotland are divided, Consumption cut off 173 in the Insular, 207 in the Mainland-Rural, but 343 in the Town Districts, during 1858.

This striking difference in the rate of mortality from Consumption among the inhabitants of Town and Country, has to a great extent been overlooked in all recent inquiries as to the varying proportions of Deaths from Consumption and Diseases of the Respiratory Organs among different

TABLE XXXVIII.—TOWN DEATHS, 1855–1858. Per Centage of Deaths to the Corrected Population of each Town, from 1855 to 1858 inclusive, and the Mean Annual Mortality during these Four Years.

Perth	2·19	2·19	3·10	2·67	2·53

classes of the community; and a high mortality from that cause has been erroneously attributed to certain trades, which results far more from the Town life than from the specific occupation. It is not intended to be denied that certain trades, where the persons are exposed to the inhalation of dusty particles, are more prolific of Consumption and Bronchitis than others where the persons breathe a pure air. But what is wished to be pointed out is the fact, that the Town residence, independent altogether of trade, causes a very much higher rate of mortality than what is witnessed in the Rural Districts. In endeavouring, therefore, to arrive at the true comparative liability of each trade to Consumption, we must compare the mortality from that cause in that trade, with the mortality from the same cause in persons living in a Town of the same size and in as crowded a state. But the fact is, a great deal too much has been written about unhealthy occupations on very insufficient data; and the results arrived at may be considered as generally erroneous, from the fact, that though many more men than women are employed in these so-called unhealthy trades, yet take all Scotland, the proportion of males in reference to the proportion of females dying from Consumption, is very much below the proportion it would be, did Consumption cut off males in the same proportion as all Diseases do. Thus we have seen that males die from all Diseases in a very much larger proportion than females. If males, then, died from Consumption in the same proportion as they die from all Diseases, for the 249 female Deaths in every hundred thousand females, we should have 274 male Deaths in a like number of males. But the males were not cut off in this proportion, but only at the rate of 263 in every hundred thousand males.

Attention is directed to these facts for the purpose of checking the very exaggerated statements that have been made relative to the comparative prevalence of Consumption and bronchial affections in different trades; and showing how careful we ought to be in statistical inquiries to eliminate the truth alone. This cannot be alone done by comparing the mortality of a trade from a specific Class of Diseases, with the mortality of the same Class of Diseases among an agricultural population who are under entirely different conditions. By making such a comparison we fearfully exaggerate the case; which, after all, may be due entirely to the hygienic or sanitary conditions of the District, may affect females in the same proportion as the males, and may have little or nothing to do with the trade followed. Thus, it cannot be pretended that there are more unhealthy trades within the City of Glasgow, in proportion to its population, than in the County of Lanark, in proportion to its population. Yet Glasgow, in 1858, lost by Consumption 386 persons out of every hundred thousand living, while the other parts of Lanarkshire only lost by Consumption in the proportion of 218 persons in every hundred thousand persons. This whole difference, then, may be safely set down to the influence of a Town residence; and even a considerable proportion of the 218 who died in what might be termed the Rural parts of Lanarkshire, must also be set down as caused by Town residence, and not by the trade followed, seeing that that County includes many large and densely peopled Towns devoted to manufacturing and mining.

These facts show how difficult it is to arrive at the true amount of mortality caused by any particular trade or occupation; and how many different circumstances have to be taken into account before we can eliminate that which is due to the trade alone.

Of the Eight Principal Towns of Scotland, the mortality from Consumption during 1858 was highest in Paisley and Greenock, and lowest in

Leith and Edinburgh. Thus, taking the proportion in every hundred thousand persons living in each Town, it would appear that 235 died from Consumption in Leith, 304 in Edinburgh, 337 in Aberdeen, 357 in Dundee, 378 in Perth, 386 in Glasgow, 400 in Greenock, and 405 in Paisley.

Of the other Tubercular Diseases in Scotland during 1858, Scrofula cut off 452, Tabes Mesenterica 763, and Hydrocephalus 1786 persons; which gives the proportion of 15, 26, and 62 Deaths respectively in every hundred thousand persons of the population.

Class IV. *Diseases of the Brain and Nervous System.*

Diseases of the Brain and Nervous System proved fatal to 4800 persons in Scotland during 1858, of whom 2577 were males and 2223 females; being in the proportion of 169 Deaths in every hundred thousand of both sexes, or 192 males and 148 females in a like number of each sex.

This Class of Diseases, like almost all others, is most fatal in the Town Districts. Thus, of every hundred thousand persons living in each of the Districts, only 104 died from this Class of Diseases in the Insular Districts, 148 in the Mainland-Rural Districts, but 211 in the Town Districts.

Of the Eight Principal Towns of Scotland, Perth furnished the greatest mortality from this Class of Diseases, Greenock the lowest. Thus, taking the proportion to every hundred thousand persons in each Town, 162 died from Diseases of the Brain and Nervous System in Greenock, 183 in Leith, 194 in Glasgow, 205 in Dundee, 218 in Paisley, 235 in Aberdeen, 261 in Edinburgh, and 313 in Perth.

Of the individual Diseases belonging to this Class, Paralysis proves the most fatal in Scotland, 1441 persons having died from that complaint in 1858. 1059 Deaths were attributed to Apoplexy, 811 to Convulsions, and 193 to Epilepsy.

Class V. *Diseases of the Heart and Organs of the Circulation.*

2261 persons died in 1858 from Diseases of the Heart and Organs of the Circulation, 1183 being males, and 1078 females. This gives the proportion of 79 Deaths in every hundred thousand persons of both sexes, or 87 males and 72 females in every hundred thousand of each sex. In every hundred thousand persons in each of the Three Great Districts into which Scotland is divided, there died from that Class of Diseases, 34 in the Insular Districts, 67 in the Mainland-Rural Districts, and 97 in the Town Districts; thus again showing that the Town mortality of even this Class of Diseases greatly exceeds that of the Insular and Mainland-Rural Deaths.

Class VI. *Diseases of the Respiratory Organs.*

The inflammatory affections of the Respiratory Organs form the third most fatal Class of Diseases to which the inhabitants of Scotland are liable. 7884 persons died from that Class of Diseases in Scotland in 1858, of whom 4095 were males, and 3789 females. This gives a proportion of 277 Deaths in every hundred thousand persons of the population, or 304 males, but only 253 females, in every hundred thousand of each sex.

It might naturally have been expected that the greater shelter afforded to the inhabitants of Towns, and the much less exposure to the inclemencies of the weather, would cause a smaller proportion of the inhabitants of Towns to

be cut off by these Diseases than in the Country, where, from the persons being more engaged in out-door occupations, they are more exposed. It happens, however, quite otherwise; for the inhabitants of the Towns are cut off by these Diseases in twice as high a proportion as in the Rural Districts. Thus, in every hundred thousand persons living in each of the Three Great Divisions of Districts in Scotland, 129 Deaths occurred from that Class of Diseases in the Insular Districts, 193 in the Mainland-Rural Districts, but no less than 405 Deaths in the Town Districts. In the great overgrown Town of Glasgow, this proportion even amounted to 533 Deaths in every hundred thousand living.

Bronchitis was by far the most fatal of the inflammatory affections of the Respiratory Organs, proving fatal to 3935 persons in Scotland during 1858. Pueumonia, or Inflammation of the Lungs, was the next fatal Disease of this Class, and cut off 2355 persons during the year. These numbers give the relative proportion of 138 and 83 Deaths respectively, in every hundred thousand persons of the population,—proportions considerably below the English proportions, which, for the same year, were 150 Deaths from Bronchitis, and 137 from Pneumonia, in every hundred thousand persons of the population.

The remaining Diseases and Classes of Disease do not seem to require special notice in this Report, as the results so very closely correspond with those of the three previous years, and it would merely be useless repetition to re-state what was said regarding them in former Reports.

Class XVII. *Violent Deaths.*

It might be expected that the Violent Deaths, from being caused by accidental circumstances, would vary very much from year to year; but the strange fact is, that their fluctuation is less almost than that of any other cause of Death. Year after year the same results turn up; the same causes which produced the Deaths in former years continuing in operation, and producing like results.

During the year 1858, the Violent Deaths amounted to 1980, or 69 Deaths in every hundred thousand persons of the population; and, as in former years, the Deaths among the male sex amounted to nearly three times that of the females; 1406 males having died Violent Deaths, but only 574 females.

The increased number of Deaths from Drowning in the Insular Districts so thoroughly compensate for the Deaths through Machinery, Railways, Carriages, and Horses in the Towns and on the Mainland, that the proportion of Violent Deaths in the Insular Districts exceeds that of the Towns and of the Mainland-Rural Districts. Thus, in every hundred thousand persons living in each of the Districts, 77 died Violent Deaths in the Insular Districts, 73 in the Town Districts, and 67 in the Mainland-Rural Districts.

Of the various forms of Accidental or Violent Deaths, 702 occurred from Fractures and Contusions, 439 from Drowning, 304 from Burns and Scalds, 79 from Wounds, 88 from the direct effects of Intemperance, 78 from Suffocation, of which number 46 were said to be overlaid in bed, 48 from want of Breast Milk, 44 from Hanging, 48 from Poison, 24 from Exposure to Cold, 5 from Privation or Want of Food, 3 from Neglect, and 118 from other Violent Causes not included in the above.

Of the above 1980 Violent Deaths, 106 were caused by Suicide, of which 40 were by hanging, 25 by Cut Throat, 17 by Drowning, 7 by

Poisoning, 2 by Gun-shot Wounds, 2 by Wounds not particularized, 1 by Precipitation from a Height, and in 12 the Special Cause was not particularized. The above numbers therefore show only 35 Suicides in every million persons of the population of Scotland during the year 1858.

The accompanying Tables show the 13 Diseases which proved most fatal in Scotland and England respectively during 1858, arranged in the order of greatest mortality, mentioning also the proportion to the respective populations in which these Diseases proved fatal. These Tables are interesting, as showing both the agreements and the differences between the two Countries, in so far as the respective fatality of the different Diseases is concerned.

INFLUENCE OF EXTERNAL AGENCIES.

The influence of External Agencies on the Births seem to be mainly limited to two causes: *first*, to the proportion of Deaths; and *secondly*, but to a smaller extent, to the Season. The *first* of these influences has been specially noted in former Reports, as well as shortly alluded to in this one, when noticing the different Birth-rates which prevail in the Insular, the Mainland-Rural, and in the Town Districts. It has been shown that there is the closest possible relation between the number of Deaths and that of Births in each of these Three Great Divisions, the relative proportion of Births and Deaths in each rising and falling with each other. The *second* of these influences (that of Season) on the number of Births, is less marked in man than in any other animal. With other living creatures the young are produced alone at that time of the year when they can find a full supply of the food necessary for the growing period, and at a season when the external or atmospheric influences are mildest, or most favourable to the delicate frames of the young. But man's dominion over Nature, and his adaptability to a civilised life, is shown in nothing more strongly than this, that the Births of his children occur with almost unfailing regularity during every month of the year, and not alone in the spring season, as with the lower creatures. Notwithstanding, however, of this general fact, even season shows itself distinctly marked in the Births; and this fact is more strikingly and also more correctly shown if we correct each month so as to exhibit the Births for 30 days, or, what comes to the same thing, show the average daily Births during each month. The accompanying Table

XXXIX. shows the facts for Scotland for the year 1858 relative to the influence of season on the number of Births. Each month is equalized to 30 days, and the number of Births given as if the odd days to be deducted or added yielded the average number of Births which occurred during the other days of the month. A single glance at this Table shows that the very same spring months within which alone the Births of almost all the lower creatures occur on this side of the equator, are also those when by far the greatest number of Births occur among the population of Scotland. March, April, and May furnished 27,735 Births, while November, December, and January only contributed 24,659 Births; in other words, each of these spring months showed an excess of upwards of 1000 Births over each of the winter months.

The Marriages, again, are under an entirely different series of influences, yet these influences are as striking as those of the Births. Like those affecting the Births, these influences may be reduced to two: *first*, the demand for labour, as indicating the commercial prosperity of the Country; and *secondly*, the effect of season,—not, however, as an effect of atmospheric agencies, but as determining the periods of the Civil Terms, when servants are released from old engagements and enter into new, and when houses are let, or change tenants. It has been well ascertained, that the demand for labour, caused by the general prosperity of the Country keeping every man employed who is willing to work, regulates the proportion of Marriages in the population to a much greater extent than the mere price of food. If labour is abundant, high price of food will not prevent an increase in the number of Marriages; but even with food abundant, at a low price, Marriages will fall off if the commercial prosperity has undergone a check, and the demand for labour is consequently diminished. This fact was most strikingly illustrated in 1858. In 1858, food was more abundant and cheaper than in 1857. Wheat, which in 1856 averaged 56s. 4d. per quarter, only averaged 44s. 2d. in 1858. But the Country was suffering from the effects of the great bank and commercial failures of November and December 1857. Hundreds of men were thrown out of employment; building, manufacturing, mining, everything languished, men were afraid to speculate. Every work which could be stopped was stopped; those which continued, employed as few hands as possible; and the consequence was, that the number of Marriages fell far below that of the two previous years.

TABLE XXXIX.—Showing the Influence of Season on the Number of BIRTHS in 1858. The Months equalized; and the Number of Births reduced to 30 days in each Month.

MONTHS.	Number of Births—each Month 30 days.	MONTHS.	Number of Births—each Month 30 days.
JANUARY . . .	8148	JULY	8486
FEBRUARY . . .	8787	AUGUST . . .	8063
MARCH	9141	SEPTEMBER . . .	7850
APRIL	9306	OCTOBER . . .	8231
MAY	9288	NOVEMBER . . .	8261
JUNE	8988	DECEMBER . . .	8249

This fact, then, shows in the clearest light the influence of commercial prosperity, or rather the demand for labour, on the number of Marriages. But the same fact is brought out with equal clearness, if we consider the different proportion of Marriages in the Insular, the Mainland-Rural, and the Town Districts of Scotland, as already pointed out at page xvi.

This *first* set of influences then, viz., the demand for labour, determine the absolute number of Marriages which occur. The *second* series of influences only determine the relative number of Marriages, and have little or no influence on the absolute number which occur during the year. The subjoined Table XL., in which the number of Marriages during each month is corrected, as was that of the Births, will illustrate these influences. By that Table it will be seen that the greatest number of Marriages occurs in June, the next greatest number in December. This results from the fact that these are the months which immediately follow the civil terms of Whitsunday and Martinmas, at which terms not only servants in Scotland who have been engaged by the year or half-year leave their places, but at these terms also no inconsiderable proportion of families change their houses. A newly married pair has therefore a better chance of getting a house at these than at other periods of the year; and owing to this and the other cause just mentioned, more Marriages occur shortly after the Terms than at any other period of the year. It will be seen, however, that the Marriages during November and January are also more numerous than during the other months. This results from the additional fact, that it is chiefly during the winter months that all our insular and maritime populations enter the bonds of matrimony. If they have been successful at the herring, cod, seal, whale, or other fisheries, or return after a successful cruise on the mainland in search of harvest work, with some spare cash in their pockets, they during this their leisure season engage in matrimony. This, taken in connection with the facts previously mentioned relative to the civil term of Martinmas, accounts for the greater number of Marriages during the months of November, December, and January.

The number of Deaths in Scotland appear to be year by year regulated by four special causes: 1st, The supply of food; including under this head the demand for labour, which enables the poorer class to procure food. 2d, The presence of Epidemics. 3d, A Town or a Country residence. 4th, Temperature, or Season. The last two are by far the most potent

---

TABLE XL.—Showing the Influence of the Civil Terms of Whitsunday and Martinmas, also the idle Winter Months, on the Number of Marriages in Scotland during the year 1858, the Months all being reduced to 30 days.

MONTHS.	Number of Marriages—each Month 30 days.	MONTHS.	Number of Marriages—each Month 30 days.

influences, and even to a great extent rule the first two. The last two causes are also those which are constantly present, and always acting; whereas insufficient supply of food, from combined defective harvests and want of demand for labour (whether from severe wintry weather arresting out-door occupations and trades, or from commercial depression), and the prevalence of virulent Epidemics, only occur at long and distant intervals, and not from year to year.

Table XLI. is drawn up with the view of enabling one to arrive at a general idea of the effect of those external agencies which arise from the supply of food, and the demand for labour; it enables us to see generally the commercial condition of the Country during the year, and to guess at the demand for labour, and the supply of food to the people, by giving the

value of the imports and exports, the price of the staple articles of food, etc. Even from that Table, then, it is seen that our commerce had sustained some severe shock. The exports during 1858 were no less than £6,391,521 lower in value than during 1857; while the imports of 1858 were the enormous sum of £23,260,609 below those of 1857. Notwithstanding this commercial stagnation, food was more abundant and cheaper than during 1857; but the people not having employment, could not purchase even that cheap food. Much distress consequently prevailed among the lower classes, and the Deaths rose higher than they had been for several previous years. No special Epidemic, however, prevailed; the mortality of all Diseases was simply increased.

Table XLI., then, taken in connection with the number of Deaths, shows in the clearest light the influence of commercial prosperity, and the demand for labour, on the number of Deaths; and proves, if anything can, that in a civilised trading population, like that of Scotland, these are much more powerful agents, as affecting the distress and Deaths, than mere price of food; for food during 1858 was much cheaper than it had been for at least the three previous years. These remarks, then, may serve to indicate the influence of the first two causes on the mortality in Scotland during 1858.

After the full notice which has already been taken at page xxv of the influence of a Town and a Rural residence on the mortality, it is unnecessary to enter into further details on the subject of the third cause above noticed; and we shall merely refer to what is there and elsewhere written.

The *fourth* and last cause which influences the number of Deaths is that which over-rides all the others, and renders each of them more fatal or less fatal, according to the season of the year when they occur. In fact, in Scotland, it is season or mean temperature which is the great agent in regulating the number of Deaths. This striking fact has been prominently noticed in all these Reports, and therefore little need be said in this beyond directing attention to the accompanying Table XLII., which shows the

TABLE XLII.—Influence of Temperature on the Mortality in Scotland during the year 1858. Each Month is equalized to 30 days, and the number of Deaths corrected to correspond. The Table, therefore, shows the Corrected Numbers and Proportions for each month for Scotland, and also for its Three Great Divisions.

MONTHS.	Mean Monthly Temperature.	Number of DEATHS Corrected to 30 Days in each Month.				Per Centage of Corrected Deaths during each Month, to the Yearly Corrected Deaths.

influence of season, not only on the mortality of all Scotland, but also on the mortality in the Insular, the Mainland-Rural, and in the Town Districts. To that Table has been appended the mean temperature of each month, inasmuch as it is the most important element of the season. But as all the other meteorological conditions aid this element, an additional Table XLIII. is added, which notices all the other important conditions of the atmosphere during each month of the year. Those who desire further information as to these meteorological conditions for the different Districts of Scotland will find full Reports in the Quarterly Returns for the year 1858.

TABLE XLIII.—METEOROLOGY OF SCOTLAND, 1858, deduced from Observations made at 51 Stations of the Meteorological Society of Scotland, the particulars of each of which are published in the Quarterly Reports of the Registrar-General for 1858.

In order, however, that Table XLII. may be rightly appreciated, it is necessary to notice shortly the atmospherical conditions during the year 1858, as they were somewhat peculiar, and by no means the same as those for England; indeed, Scotland and England, closely adjoining as they are, differ in many important points in their meteorological conditions, so that the meteorology of the one could never with safety be considered as applicable to the other.

During January and February of 1858, the weather was unusually mild and open; and though the mean temperature was gradually falling, it was not till the 1st of March that winter, with its frosts and severe snow-storms, fairly set in over the Country. The mean temperature of January had been 39°·3, that of February 35°·8; but during the first fortnight of March the mean temperature was only 32°. This fact, then, at once serves to account for March yielding the greatest number of Deaths. The mere knowledge of the mean monthly temperature would have failed to account for the observed greater mortality; but when we know that the first fortnight of March was really the most wintry and coldest period of all the early months of the year, the fact is at once accounted for. From the middle of March the weather improved; thaw, mild winds, and sunshine raised the mean temperature of the latter half of March to 42°; and though occasional falls of snow, and cold northerly and easterly winds in April, kept the mean temperature of that month low, and the Deaths high, the weather improved in temperature till the end of June. After this, cooler weather set in; and the mean temperature, instead of rising, as usual, during July and August, above that of June, fell below it. October proved a colder month than usual, as was also November; and during the third week of November severe stormy weather, accompanied by keen frosts and heavy falls of snow, occurred. December was also a stormy month; but from many of the gales coming from the south-west, the mean temperature, instead of falling as usual below that of November, was somewhat above it. This seems to account for the fact that the corrected Deaths for December were fewer than during November.

I have the honour to be,

Sir,

Your most obedient Servant,

JAMES STARK.

General Registry Office of Births, etc.,
12*th January* 1863.

ABSTRACTS

OF

BIRTHS, DEATHS, AND MARRIAGES,

1858.

* In all the Counties marked thus *, the number of Acres is given from actual survey by the Ordnance Staff; and these measurements were procured from the Ordnance Survey Office, through the kindness of Col. Sir Henry James. The measurements of the other Counties, with the exception of Shetland and Orkney, are taken from Major Dawson's estimate for the Census of 1851. In that estimate he included as land all the channels between the islands in Shetland and Orkney. These channels are excluded in the estimate given in the above Table.
